

# Package ‘GeNetIt’

January 20, 2025

**Type** Package

**Title** Spatial Graph-Theoretic Genetic Gravity Modelling

**Version** 0.1-6

**Date** 2023-06-04

**Description** Implementation of spatial graph-theoretic genetic gravity models.

The model framework is applicable for other types of spatial flow questions.

Includes functions for constructing spatial graphs, sampling and summarizing associated raster variables and building unconstrained and singly constrained gravity models.

**Depends** R (>= 4.2.0), nlme

**Imports** exactextractr, terra, sf, sfnetworks, igraph, dplyr,  
tidygraph, spdep

**Maintainer** Jeffrey S. Evans <jeffrey\_evans@tnc.org>

**License** GPL-3

**URL** <https://github.com/jeffreyevans/GeNetIt>

**NeedsCompilation** no

**Repository** CRAN

**Encoding** UTF-8

**LazyData** true

**RoxygenNote** 7.2.3

**Author** Jeffrey S. Evans [aut, cre],  
Melanie Murphy [aut]

**Date/Publication** 2023-06-15 00:02:12 UTC

---

<b>adj_matrix</b>	<i>Binary adjacency matrix</i>
-------------------	--------------------------------

---

**Description**

Creates a binary matrix of adjacencies based on from-to graph relationships (joins)

**Usage**

```
adj_matrix(i, j = NULL)
```

**Arguments**

- i            a vector or, if j = NULL a data.frame with two columns indicating from-to relationships (joins)
- j            If specified, i must be a vector of same length and the i,j vectors must represent joins

**Value**

A binary matrix

**Author(s)**

Jeffrey S. Evans <jeffrey\_evans@tnc.org> and Melanie A. Murphy <melanie.murphy@uwyo.edu>

## Examples

```
library(sf)
data(ralu.site, package="GeNetIt")

p <- as(ralu.site, "sf")
g <- knn.graph(p[c(1,5,8,10,20,31),])
plot(st_geometry(g))

( ind <- sf::st_drop_geometry(g[,1:2])[1:10,] )

adj_matrix(ind)

adj_matrix(g$i[1:10], g$j[1:10])
```

---

area.graph.statistics *Statistics for edges (lines) based on a defined scale (area).*

---

## Description

Samples rasters for each edge and calculates specified statistics for buffer distance

## Usage

```
area.graph.statistics(...)
```

## Arguments

... Parameters to be passed to the modern version of the function

## Note

Please note that this function has been deprecated, please use graph.statistics with the buffer argument.

---

build.node.data      *Build node data*

---

## Description

Helper function to build the origin/destination node data structure.

## Usage

```
build.node.data(x, group.ids, from.parms, to.parms = NULL)
```

**Arguments**

x	A data.frame containing node (site) data
group.ids	Character vector of unique identifier that can be used to join to graph
from.parms	Character vector of independent "from" variables
to.parms	Character vector of independent "to" variables. If NULL is the same as from.parms

**Value**

```
data.frame
```

**Note**

Unless a different set of parameters will be used as the destination (to) there is no need to define the argument "to.parms" and the "from.parm" will be used to define both set of parameters.

The resulting data.frame represents the origin (from) and destination (to) data structure for use in gravity model. This is node structure is also known in the gravity literature as producer (from) and attractor (to).

**Author(s)**

Jeffrey S. Evans <jeffrey\_evans@tnc.org> and Melanie A. Murphy <melanie.murphy@uwyo.edu>

**Examples**

```
data(ralu.site)

# Build from/to site (node) level data structure
site.parms = c("AREA_m2", "PERI_m", "Depth_m", "TDS")
site <- build.node.data(sf::st_drop_geometry(ralu.site),
                       group.ids = c("SiteName"),
                       from.parms = site.parms )
```

**Description**

Prints diagnostic statistics for comparing gravity models

**Usage**

```
compare.models(...)
```

**Arguments**

...	gravity model objects
-----	-----------------------

**Details**

Results include model name, AIX, BIC, log likelihood, RMSE and number of parameters

**Value**

data.frame of competing model statistics

**Author(s)**

Jeffrey S. Evans <jeffrey\_evans@tnc.org> and Melanie A. Murphy <melanie.murphy@uwyo.edu>

**References**

Murphy M.A., R. Dezzani, D.S. Pilliod & A.S. Storfer (2010) Landscape genetics of high mountain frog metapopulations. Molecular Ecology 19(17):3634-3649

**Examples**

```
library(nlme)
data(ralu.model)

x = c("DEPTH_F", "HLI_F", "CTI_F", "cti", "ffp")
( null <- gravity(y = "DPS", x = c("DISTANCE"), d = "DISTANCE",
                   group = "FROM_SITE", data = ralu.model, fit.method = "ML") )
( gm_h1 <- gravity(y = "DPS", x = x, d = "DISTANCE", group = "FROM_SITE",
                     data = ralu.model, ln = FALSE, fit.method="ML") )
( gm_h2 <- gravity(y = "DPS", x = x[1:3], d = "DISTANCE", group = "FROM_SITE",
                     data = ralu.model, ln = FALSE, fit.method="ML") )
( gm_h3 <- gravity(y = "DPS", x = x[c(4:5)], d = "DISTANCE", group = "FROM_SITE",
                     data = ralu.model, ln = FALSE, fit.method="ML") )
#( gm_h4 <- gravity(y = "DPS", x = x[c(4:5)], d = "DISTANCE", group = "FROM_SITE",
#                     data = ralu.model, ln = FALSE, fit.method="REML") )

compare.models(null, gm_h1, gm_h2, gm_h3)
```

**Description**

Subset of data used in Murphy et al., (2010)

## Format

A 30m LZW compressed tiff:

```
rows 426
columns 358
resoultion 30 meter
projection "+proj=utm +zone=11 +datum=NAD83 +units=m +no_defs +ellps=GRS80 +towgs84=0,0,0"
cti Compound Topographic Index ("wetness")
err27 Elevation Relief Ratio
ffp Frost Free Period
gsp Growing Season Precipitation
hil Heat Load Index
nlcd USGS Landcover
```

## References

**dmatrix.df**

*Distance matrix to data.frame*

## Description

Coerces distance matrix to a data.frame object

## Usage

```
dmatrix.df(x, rm.diag = TRUE)
```

## Arguments

<b>x</b>	Symmetrical distance matrix
<b>rm.diag</b>	(TRUE/FALSE) remove matrix diagonal, self values.

## Value

data.frame object representing to and from values

## Note

Function results in data.frame object with "X1" (FROM), "X2" (TO) and "distance" columns. The FROM column represents to origin ID, TO represents destination ID and distance is the associated matrix distance. These results can be joined back to the graph object using either the origin or destination ID's.

**Author(s)**

Jeffrey S. Evans <jeffrey\_evans@tnc.org> and Melanie A. Murphy <melanie.murphy@uwyo.edu>

**Examples**

```
library(sf)
pts <- data.frame(ID=paste0("ob",1:15), x=runif(15, 480933, 504250),
                   y=runif(15, 4479433, 4535122))
pts <- st_as_sf(pts, coords = c("x", "y"),
                 crs = 32611, agr = "constant")

# Create distance matrix
dm <- st_distance(pts)
class(dm) <- setdiff(class(dm), "units")
attr(dm, "units") <- NULL
colnames(dm) <- pts$ID
rownames(dm) <- pts$ID

# Coerce to data.frame with TO and FROM ID's and associated distance
dm.df <- dmatrix.df(dm)
head(dm.df)
```

---

dps

*dps* genetic distance matrix for Columbia spotted frog (*Rana luteiventris*)

---

**Description**

Subset of data used in Murphy et al., (2010)

**Format**

A 29 x 29 genetic distance matrix:

**References**

Murphy M.A., R. Dezzani, D.S. Pilliod & A.S. Storfer (2010) Landscape genetics of high mountain frog metapopulations. Molecular Ecology 19(17):3634-3649

**flow** *Convert distance to flow*

## Description

Converts distance (1-d) with or without data standardization

## Usage

```
flow(x, standardize = FALSE, rm.na = FALSE, diag.value = NA)
```

## Arguments

<code>x</code>	A numeric vector or matrix object representing distances
<code>standardize</code>	(FALSE/TRUE) Row-standardize the data before calculating flow
<code>rm.na</code>	(TRUE/FALSE) Should NA's be removed, if FALSE (default) the will be retained in the results
<code>diag.value</code>	If <code>x</code> is a matrix, what diagonal matrix values should be used (default is NA)

## Value

A vector or matrix representing flow values

## Author(s)

Jeffrey S. Evans <jeffrey\_evans@tnc.org> and Melanie A. Murphy <melanie.murphy@uwyo.edu>

## Examples

```
#### On a distance vector
flow(runif(10,0,1))
flow(runif(10,0,500), standardize = TRUE)

# With NA's
d <- runif(10, 0,1)
d[2] <- NA
flow(d)
flow(d, rm.na=TRUE)

#### On a distance matrix
dm <- as.matrix(dist(runif(5,0,1), diag = TRUE, upper = TRUE))
flow(dm)
```

---

**graph.metrics**      *Graph Metrics*

---

**Description**

Metrics on structural properties of graph (at nodes)

**Usage**

```
graph.metrics(  
  x,  
  node pts,  
  node.name = NULL,  
  direct = FALSE,  
  metric = c("betweenness", "degree", "closeness")  
)
```

**Arguments**

x	knn graph object from GeNetIt::knn.graph (sf LINESTRING)
node pts	sf POINT or sp SpatialPointsDataFrame object used as nodes to build x
node.name	Column name in node pts object that acts as the provides the unique ID. If not defined, defaults to row.names of node pts
direct	(FALSE/TRUE) Evaluate directed graph
metric	...

**Note**

Please note; graph metrics are not valid for a saturated graph (all connections)

**Author(s)**

Jeffrey S. Evans <jeffrey\_evans@tnc.org> and Melanie A. Murphy <melanie.murphy@uwyo.edu>

**Examples**

```
library(sf)  
data(ralu.site, package="GeNetIt")  
  
graph <- knn.graph(ralu.site, row.names=ralu.site$SiteName,  
                   max.dist = 2500)  
plot(st_geometry(graph))  
  
( m <- graph.metrics(graph, ralu.site, "SiteName") )  
  
ralu.site <- merge(ralu.site, m, by="SiteName")  
# plot node betweenness
```

```

plot(st_geometry(graph), col="grey")
plot(ralu.site["betweenness"], pch=19, cex=1.25, add=TRUE)
# plot node degree
plot(st_geometry(graph), col="grey")
plot(ralu.site["degree"], pch=19, cex=1.25, add=TRUE)

```

**graph.statistics**      *Statistics for edges (lines)*

## Description

Extracts raster values for each edge and calculates specified statistics

## Usage

```
graph.statistics(x, r, stats = c("min", "mean", "max"), buffer = NULL)
```

## Arguments

x	sp SpatialLinesDataFrame or sf LINE object
r	A terra SpatRaster or raster rasterLayer, rasterStack, rasterBrick object
stats	Statistics to calculate. If vectorized, can pass a custom statistic function.
buffer	Buffer distance, radius in projection units. For statistics based on edge buffer distance

## Value

data.frame object of statistics

## Note

If the buffer argument is specified that, raster values within the specified buffer radius are extracted and included in the derived statistic(s). Else-wise, the statistics are derived from raster values that directly intersect each edge.

## Author(s)

Jeffrey S. Evans <jeffrey\_evans@tnc.org> and Melanie A. Murphy <melanie.murphy@uwyo.edu>

## Examples

```

library(sf)
library(terra)

data(ralu.site)
xvars <- rast(system.file("extdata/covariates.tif", package="GeNetIt"))

( dist.graph <- knn.graph(ralu.site, row.names = ralu.site$SiteName,
                           max.dist = 1500) )

skew <- function(x, na.rm = TRUE) {
  if (na.rm) x <- x[!is.na(x)]
  sum( (x - mean(x)) ^ 3) / ( length(x) * sd(x) ^ 3 )
}

# Moments on continuous raster data
system.time( {
  stats <- graph.statistics(dist.graph, r = xvars[[-6]],
                             stats = c("min", "median", "max", "var", "skew"))
} )

# Proportional function on nominal raster data
p <- function(x) { length(x[x < 52]) / length(x) }

system.time( {
  nstats <- graph.statistics(dist.graph, r = xvars[[6]],
                             stats = "p")
} )

# Based on 500m buffer distance around line(s)
system.time( {
  stats <- graph.statistics(dist.graph, r = xvars[[-6]],
                             stats = c("min", "median", "max", "var", "skew"),
                             buffer = 500)
} )

```

gravity

*Gravity model*

## Description

Implements Murphy et al., (2010) gravity model via a linear mixed effects model

## Usage

```
gravity(
```

```

y,
x,
d,
group,
data,
fit.method = c("REML", "ML"),
ln = TRUE,
constrained = TRUE,
...
)

```

### Arguments

y	Name of dependent variable
x	Character vector of independent variables
d	Name of column containing distance
group	Name of grouping column (from or to)
data	data.frame object containing model data
fit.method	Method used to fit model c("REML", "ML")
ln	Natural log transform data (TRUE/FALSE)
constrained	Specify constrained model, if FALSE a linear model (lm) is run (TRUE/FALSE)
...	Additional argument passed to nlme or lm

### Details

The "group" factor defines the singly constrained direction (from or to) and the grouping structure for the origins. To specify a null (distance only or IBD) model just omit the x argument.

By default constrained models are fit by maximizing the restricted log-likelihood (REML), for maximum likelihood use the type="ML" argument which is passed to the lme function. If ln=TRUE the input data will be log transformed

### Value

formula Model formula call  
 fixed.formula Model formula for fixed effects  
 random.formula Model formula for random (group) effects (only for constrained models)  
 gravity Gravity model  
 fit Model Fitted Values  
 AIC AIC value for selected model  
 RMSE Root Mean Squared Error (based on bias corrected back transform)  
 log.likelihood Restricted log-likelihood at convergence  
 group.names Column name of grouping variable  
 groups Values of grouping variable

x data.frame of x variables  
y Vector of y variable  
constrained TRUE/FALSE indicating if model is constrained

**Note**

Depends: nlme, lattice

**Author(s)**

**Examples**

```
library(nlme)
data(ralu.model)

# Gravity model
x = c("DEPTH_F", "HLI_F", "CTI_F", "cti", "ffp")
( gm <- gravity(y = "DPS", x = x, d = "DISTANCE", group = "FROM_SITE",
                  data = ralu.model, ln = FALSE) )

#' # Plot gravity results
par(mfrow=c(2,3))
for (i in 1:6) { plot(gm, type=i) }

# log likelihood of competing models
x = c("DEPTH_F", "HLI_F", "CTI_F", "cti", "ffp")
for(i in x[-1]) {
  x1 = c(x[1], x[-which(x %in% i)])
  ll <- gravity(y = "DPS", x = x1, d = "DISTANCE", group = "FROM_SITE",
                 data = ralu.model, ln = FALSE)$log.likelihood
  cat("log likelihood for parameter set:", "(", x1, ")", "=", ll, "\n")
}

# Distance only (IBD) model
gravity(y = "DPS", d = "DISTANCE", group = "FROM_SITE",
```

```
data = ralu.model, ln = FALSE)
```

gravity.es

*Effect Size*

## Description

Cohen's D effect size for gravity models

## Usage

```
gravity.es(x, actual.n = FALSE, alpha = 0.95)
```

## Arguments

x	gravity model object
actual.n	(FALSE/TRUE) Use actual N or degrees of freedom in calculating Confidence Interval
alpha	confidence interval

## Details

Calculate Cohen's D statistic for each effect in a gravity model object

## Value

data.frame of parameter effect size

## Author(s)

Jeffrey S. Evans <jeffrey\_evans@tnc.org> and Melanie A. Murphy <melanie.murphy@uwyo.edu>

## References

 Cohen, J. (1988) Statistical power for the behavioral sciences (2nd ed.). Hillsdale, NJ: Erlbaum

## Examples

```
library(nlme)
data(ralu.model)

x = c("DEPTH_F", "HLI_F", "CTI_F", "cti", "ffp")
gm_h1 <- gravity(y = "DPS", x = x, d = "DISTANCE", group = "FROM_SITE",
                   data = ralu.model, ln = FALSE, method="ML")

gravity.es(gm_h1)
```

**knn.graph***Saturated or K Nearest Neighbor Graph***Description**

Creates a kNN or saturated graph SpatialLinesDataFrame object

**Usage**

```
knn.graph(
  x,
  row.names = NULL,
  k = NULL,
  max.dist = NULL,
  long.lat = FALSE,
  drop.lower = FALSE
)
```

**Arguments**

x	sf POINTS object
row.names	Unique row.names assigned to results
k	K nearest neighbors, defaults to saturated ( $n(x) - 1$ )
max.dist	Maximum length of an edge (used for distance constraint)
long.lat	(FALSE/TRUE) Coordinates are longitude-latitude decimal degrees, in which case distances are measured in kilometers
drop.lower	(FALSE/TRUE) Drop lower triangle of matrix representing duplicate edges ie, from-to and to-from

**Value**

SpatialLinesDataFrame object with:

- i Name of column in x with FROM (origin) index
- j Name of column in x with TO (destination) index
- from\_ID Name of column in x with FROM (origin) region ID
- to\_ID Name of column in x with TO (destination) region ID
- length Length of each edge (line) in projection units or kilometers if not projected

**Note**

...

  box()
  title("Saturated graph")
  plot(st_geometry(dist.graph), col="grey")
  points(st_coordinates(ralu.site), col="red", pch=20, cex=1.5)
  box()
  title("Distance constrained graph")
par(opar)
```

**node.statistics**      *raster statistics for nodes*

## Description

returns raster value or statistics (based on specified radius) for node

## Usage

```
node.statistics(x, r, buffer = NULL, stats = c("min", "median", "max"))
```

## Arguments

x	sp class SpatialPointsDataFrame object
r	A rasterLayer, rasterStack or rasterBrick object
buffer	Buffer distance, radius in projection units
stats	Statistics to calculate. If vectorized, can pass a custom statistic function.

**Value**

data.frame object of at-node raster values or statistics

**Note**

If no buffer is specified, at-node raster values are returned

**Author(s)**

Jeffrey S. Evans <jeffrey\_evans@tnc.org> and Melanie A. Murphy <melanie.murphy@uwyo.edu>

**Examples**

```
library(sf)
library(terra)

data(ralu.site)
xvars <- rast(system.file("extdata/covariates.tif", package="GeNetIt"))

skew <- function(x, na.rm = TRUE) {
  if (na.rm) x <- x[!is.na(x)]
  sum( (x - mean(x)) ^ 3) / ( length(x) * sd(x) ^ 3 )
}

# without buffer (values at point)
system.time( {
  stats <- node.statistics(ralu.site, r = xvars[[-6]])
} )

# with 1000m buffer (values around points)
system.time( {
  stats <- node.statistics(ralu.site, r = xvars[[-6]], buffer = 1000,
    stats = c("min", "median", "max", "var", "skew"))
} )
```

`plot.gravity`

*Plot gravity model*

**Description**

Diagnostic plots gravity model with 6 optional plots.

**Usage**

```
## S3 method for class 'gravity'
plot(x, type = 1, ...)
```

**Arguments**

x	Object of class gravity
type	Type of plot (default 1, model structure I)
...	Ignored

**Value**

defined plot

**Note**

Plot types available: 1 - Model structure I, 2 - Model structure II, 3 - Q-Q Normal - Origin random effects, 4 - Q-Q Normal - Residuals , 5 - Fitted values, 6 - Distribution of observed verses predicted

Depends: nlme, lattice

**Author(s)**

Jeffrey S. Evans <jeffrey\_evans@tnc.org> and Melanie A. Murphy <melanie.murphy@uwyo.edu>

**References**

- Murphy, M. A. & J.S. Evans. (in prep). "GenNetIt: gravity analysis in R for landscape genetics"

**predict.gravity**      *Predict gravity model*

**Description**

predict method for class "gravity"

**Usage**

```
## S3 method for class 'gravity'
predict(
  object,
  newdata,
  groups = NULL,
  back.transform = c("none", "simple", "Miller", "Naihua"),
  ...
)
```

**Arguments**

object	Object of class gravity
newdata	New data used for obtaining the predictions, can be a data.frame or nffGroupedData
groups	Grouping factor acting as random effect. If used, must match levels used in model, otherwise leave it null and do not convert to groupedData
back.transform	Method to back transform data, default is none and log predictions will be returned.
...	Arguments passed to predict.lme or predict.lm

**Details**

Please note that the entire gravity equation is log transformed so, your parameter space is on a log scale, not just y. This means that for a meaningful prediction the "newdata" also needs to be on a log scale.

For the back.transform argument, the simple back-transform method uses the form  $\exp(\hat{y})0.5*\text{variance}$  whereas Miller uses  $\exp(\sigma)^{0.5}$  as the multiplicative bias factor. Naihua regresses  $y \sim \exp(\hat{y})$  with no intercept and uses the resulting coefficient as the multiplicative bias factor. The Naihua method is intended for results with non-normal errors. You can check the functional form by simply plotting y (non-transformed) against the fit. The default is to output the log scaled predictions.

**Value**

Vector of model predictions

**Author(s)**

Jeffrey S. Evans <jeffrey\_evans@tnc.org> and Melanie A. Murphy <melanie.murphy@uwyo.edu>

**Examples**

```
library(nlme)
data(ralu.model)

back.transform <- function(y) exp(y + 0.5 * stats::var(y, na.rm=TRUE))
rmse = function(p, o){ sqrt(mean((p - o)^2)) }

x = c("DEPTH_F", "HLI_F", "CTI_F", "cti", "ffp")

sidx <- sample(1:nrow(ralu.model), 100)
train <- ralu.model[sidx,]
```

```

test <- ralu.model[-sidx,]

# Specify constrained gravity model
( gm <- gravity(y = "DPS", x = x, d = "DISTANCE", group = "FROM_SITE",
                  data = train, ln = FALSE) )

( p <- predict(gm, test[,c(x, "DISTANCE")]) )
rmse(back.transform(p), back.transform(ralu.model[,"DPS"][-sidx])))

# WIth model sigma-based back transformation
( p <- predict(gm, test[,c(x, "DISTANCE")], back.transform = "simple") )
( p <- predict(gm, test[,c(x, "DISTANCE")], back.transform = "Miller") )
( p <- predict(gm, test[,c(x, "DISTANCE")], back.transform = "Naihua") )

# Using grouped data
test <- nlme::groupedData(stats::as.formula(paste(paste("DPS", 1, sep = " ~ "),
                                                 "FROM_SITE", sep = " | "))),
                           data = test[,c("DPS", "FROM_SITE", x, "DISTANCE")])

( p <- predict(gm, test, groups = "FROM_SITE") )
( y.hat <- back.transform(ralu.model[,"DPS"][-sidx]) )
na.idx <- which(is.na(p))
rmse(back.transform(p)[-na.idx], y.hat[-na.idx]))

# Specify unconstrained gravity model (generally, not recommended)
( gm <- gravity(y = "DPS", x = x, d = "DISTANCE", group = "FROM_SITE",
                  data = train, ln = FALSE, constrained=TRUE) )

( p <- predict(gm, test[,c(x, "DISTANCE")]) )
rmse(back.transform(p), back.transform(ralu.model[,"DPS"][-sidx]))

```

**print.gravity***Print gravity model***Description**

summary method for class "gravity"

**Usage**

```
## S3 method for class 'gravity'
print(x, ...)
```

**Arguments**

x	Object of class gravity
...	Ignored

---

**ralu.model**

*Columbia spotted frog (Rana luteiventris) data for specifying gravity model. Note, the data.frame is already log transformed.*

---

## Description

Subset of data used in Murphy et al., (2010)

## Format

A data.frame with 190 rows (sites) and 19 columns (covariates):

**ARMI\_ID** Unique ID

**FROM\_SITE** Unique from site ID

**TO\_SITE** Unique to site ID

**FST** FST genetic distance

**DPS** DPS genetic distance

**DISTANCE** Graph edge distance

**DEPTH\_F** At site water depth

**HLI\_F** Heat Load Index

**CTL\_F** Wetness Index

**DEPTH\_T** At site water depth

**HLI\_T** Heat Load Index

**CTL\_T** Wetness Index

**hli** Heat Load Index

**cti** Wetness Index

**ffp** Frost Free Period

**err27** Roughness at 27x27 scale

**rsp** Relative Slope Position

**ridge** Percent Ridge Line

**hab\_ratio** Ratio of suitable dispersal habitat

---

ralu.site

*Subset of site-level spatial point data for Columbia spotted frog (*Rana luteiventris*)*

---

## Description

Subset of data used in Murphy et al., (2010)

## Format

An sf POINT object with 31 obs. of 17 variables:

**SiteName** Unique site name

**Drainage** Source drainage

**Basin** source basin

**Substrate** Wetland substrate

**NWI** USFWS NWI Wetland type

**AREA\_m2** Area of wetland

**PERI\_m** Perimeter of wetland

**Depth\_m** Depth of wetland

**TDS** ...

**FISH** Fish present

**ACB** ...

**AUC** ...

**AUCV** ...

**AUCC** ...

**AUF** ...

**AWOOD** ...

**AUFV** ...

**summary.gravity**      *Summarizing Gravity Model Fits*

---

**Description**

Summary method for class "gravity".

**Usage**

```
## S3 method for class 'gravity'  
summary(object, ...)
```

**Arguments**

object	Object of class gravity
...	Ignored

**Note**

Summary of lme or lm gravity model, AIC, log likelihood and Root Mean Square Error (RMSE) of observed verses predicted
