## Package 'RcppQuantuccia'

January 20, 2025

Type Package

Title R Bindings to the Calendaring Functionality of 'QuantLib'

Version 0.1.2

Date 2023-11-29

Author Dirk Eddelbuettel; the authors and contributors of QuantLib

Maintainer Dirk Eddelbuettel <edd@debian.org>

**Description** 'QuantLib' bindings are provided for R using 'Rcpp' via an updated variant of the header-only 'Quantuccia' project (put together initially by Peter Caspers) offering an essential subset of 'QuantLib' (and now maintained separately for the calendaring subset). See the included file 'AUTHORS' for a full list of contributors to both 'QuantLib' and 'Quantuccia'.

BugReports:	https://github.com/eddelbuettel/rcppquantuccia/issues
License:	GPL (>= 2)
Imports:	Rcpp
LinkingTo:	Rcpp, BH
RoxygenNote:	6.0.1
NeedsCompilation:	yes
Encoding:	UTF-8

## adjust\_cpp

## **Package Content**

Index of help topics:

RcppQuantuccia-package

	R Bindings to the Calendaring Functionality of
	'QuantLib'
adjust_cpp	Compute adjusted dates
advanceDate	Advance a date
advanceUnits_cpp	Compute adjusted dates
businessDaysBetween	Compute number of business dates between
	calendar dates
calendars	The 'calendars' vector contains all calendar
	identifiers.
getEndOfMonth	Compute end-of-month
getHolidays	Compute holidays or business days
getName	Get calendar name, or id
isBusinessDay	Test for business days
isEndOfMonth	Test for end-of-month
isHoliday	Test for holidays
isWeekend	Test for weekends
setCalendar	Set a calendar

#### Maintainer

Dirk Eddelbuettel <edd@debian.org>

## Author(s)

Dirk Eddelbuettel; the authors and contributors of QuantLib

adjust\_cpp Compute adjusted dates

## Description

Adjust a vector of dates following a business-day convention

## Usage

```
adjust_cpp(dates, bdc = 0L)
adjust(dates, bdc = c("Following", "ModifiedFollowing", "Preceding",
    "ModifiedPreceding", "Unadjusted", "HalfMonthModifiedFollowing", "Nearest"))
```

#### Arguments

dates	A Date vector with dates
bdc	A character variable describing one of several supported values, the C++ version implements expects a corresponding integer value

## Details

This function takes a vector of dates and returns another vector of dates of the same length returning at each position the adjusted date according to the selected business-day convention. Currently supported values for the business day convention are (starting from zero): 'Following', 'ModifiedFollowing', 'Preceding', 'ModifiedPreceding', 'Unadjusted', 'HalfModifiedFollowing' and 'Nearest'.

#### Value

A Date vector with dates adjust according to business-day convention

#### Examples

adjust(Sys.Date()+0:6)

advanceDate	Advance a date	

#### Description

Advance a date to the next business day plus an optional shift

#### Usage

advanceDate(rd, days = 0L)

#### Arguments

rd	A Date object describing the date to be advanced to the next business day.
days	An optional integer offset applied to the date

#### Details

This function takes a given date and advances it to the next business day under the current (global) calendar setting. If an optional offset value is given it is applied as well.

## Value

The advanced date is returned

#### Examples

```
advanceDate(Sys.Date(), 2) # today to the next biz day, plus 2 days
```

advanceUnits\_cpp Compute adjusted dates

#### Description

Advance a vector of dates by a given number of time units

#### Usage

advanceUnits\_cpp(dates, n, unit, bdc, emr)

```
advanceUnits(dates, n, unit = c("Days", "Weeks", "Months", "Years", "Hours",
    "Minutes", "Seconds", "Milliseconds", "Microseconds"), bdc = c("Following",
    "ModifiedFollowing", "Preceding", "ModifiedPreceding", "Unadjusted",
    "HalfMonthModifiedFollowing", "Nearest"), emr = FALSE)
```

#### Arguments

dates	A Date vector with dates
n	An integer variable with the number of units to advance
unit	A character variable describing one of several supported values; the C++ version implements expects a corresponding integer value
bdc	A character variable describing one of several supported values, the C++ version implements expects a corresponding integer value
emr	A boolean variable select end-of-month, default is 'FALSE'

## Details

This function takes a vector of dates and returns another vector of dates of the same length returning at each position the date advanced by the given number of steps in the selected time unit, also respecting a business day convention and and of month boolean switch. Currently supported values for the time unit are 'Days', 'Weeks', 'Months' 'Years', 'Hours', 'Seconds', 'Milliseconds' and 'Microseconds'; all are specified as integers. Note that intra-daily units are not currently supported for advancing 'Date' objects. Currently supported values for the business day convention are (starting from zero): 'Following', 'ModifiedFollowing', 'Preceding', 'ModifiedPreceding', 'Unadjusted', 'HalfModifiedFollowing' and 'Nearest'.

#### Value

A Date vector with dates advanced according to the selected inputs

#### Examples

```
advanceUnits(Sys.Date()+0:6, 5, "Days", "Following")
```

businessDaysBetween Compute number of business dates between calendar dates

## Description

Compute the number of business days between dates

#### Usage

```
businessDaysBetween(from, to, includeFirst = TRUE, includeLast = FALSE)
```

## Arguments

from	A Date vector with interval start dates
to	A Date vector with interval end dates
includeFirst	A boolean indicating if the start date is included, default is 'TRUE'
includeLast	A boolean indicating if the end date is included, default is 'FALSE'

## Details

This function takes two vectors of start and end dates and returns another vector of the number of business days between each corresponding date pair according to the active calendar.

#### Value

A numeric vector with the number of business dates between the corresponding date pair

## Examples

businessDaysBetween(Sys.Date() + 0:6, Sys.Date() + 3 + 0:6)

calendars

The calendars vector contains all calendar identifiers.

## Description

The calendars vector contains all calendar identifiers.

## Examples

head(calendars, 10)

getEndOfMonth

#### Description

Compute a vector of dates with end-of-month

## Usage

getEndOfMonth(dates)

## Arguments

dates A Date vector with dates

## Details

This function takes a vector of dates and returns another vector of dates of the same length returning at each position whether the corresponding end-of-month date in the currently active (global) calendar.

## Value

A Date vector with dates which are end-of-month

## Examples

```
getEndOfMonth(Sys.Date()+0:6)
```

getHolidays

Compute holidays or business days

## Description

Compute the number of holidays (or business days) between two dates

#### Usage

```
getHolidays(from, to, includeWeekends = FALSE)
```

getBusinessDays(from, to)

## Arguments

from	A Date object with the start date
to	A Date object with the end date
includeWeekends	5
	A boolean indicating if weekends should be included, default is 'FALSE'

## Details

This function takes a start and end date and returns a vector of holidays (or business days) between them according to the active calendar.

## Value

A Date vector with holidays or business days between the given dates

## Examples

getHolidays(Sys.Date(), Sys.Date() + 30)

getName

Get calendar name, or id

## Description

Get calendar name or id

#### Usage

getName()

getId()

## Details

This function returns the corresponding (full) name (as in the underlying implementationclass) or identification string (used to select it) of the current calendar.

## Value

A string with the calendar name

## Examples

getName()

isBusinessDay Test for business days

#### Description

Test a vector of dates for business day

## Usage

isBusinessDay(dates)

## Arguments

dates

A Date vector with dates to be examined

## Details

This function takes a vector of dates and returns a logical vector of the same length indicating at each position whether the corresponding date is a business day in the currently active (global) calendar.

## Value

A logical vector indicating which dates are business days

#### Examples

isBusinessDay(Sys.Date()+0:6)

isEndOfMonth Test for end-of-month

## Description

Test a vector of dates for end-of-month

## Usage

```
isEndOfMonth(dates)
```

#### Arguments

dates A Date vector with dates to be examined

## Details

This function takes a vector of dates and returns a logical vector of the same length indicating at each position whether the corresponding date is at the end of a month in the currently active (global) calendar.

## Value

A logical vector indicating which dates are end-of-month

#### Examples

```
isEndOfMonth(Sys.Date()+0:6)
```

isHoliday

Test for holidays

## Description

Test a vector of dates for holiday

#### Usage

isHoliday(dates)

#### Arguments

dates A Date vector with dates to be examined

## Details

This function takes a vector of dates and returns a logical vector of the same length indicating at each position whether the corresponding date is a holiday in the currently active (global) calendar.

#### Value

A logical vector indicating which dates are holidays

## Examples

isHoliday(Sys.Date()+0:6)

isWeekend

#### Description

Test a vector of dates for weekends

#### Usage

isWeekend(dates)

## Arguments

dates A Date vector with dates to be examined

#### Details

This function takes a vector of dates and returns a logical vector of the same length indicating at each position whether the corresponding date is a weekend in the currently active (global) calendar.

## Value

A logical vector indicating which dates are weekends

## Examples

isWeekend(Sys.Date()+0:6)

setCalendar Set a calendar

#### Description

Set a calendar

## Usage

```
setCalendar(calstr)
```

#### Arguments

calstr A character variable containing the market for which a calendar is to be set

#### Details

This function sets a calendar to the given market or country convention. Note that at present only the default 'TARGET' and 'UnitedStates' are supported.

## setCalendar

## Value

Nothing is returned but the global state is changed

## Examples

```
setCalendar("UnitedStates")
```
