Package 'arsenal'

October 12, 2022

Title An Arsenal of 'R' Functions for Large-Scale Statistical Summaries

Version 3.6.3

Date 2021-06-04

- **Description** An Arsenal of 'R' functions for large-scale statistical summaries, which are streamlined to work within the latest reporting tools in 'R' and 'RStudio' and which use formulas and versatile summary statistics for summary tables and models. The primary functions include tableby(), a Table-1-like summary of multiple variable types 'by' the levels of one or more categorical variables; paired(), a Table-1-like summary of multiple variable types paired across two time points; modelsum(), which performs simple model fits on one or more endpoints for many variables (univariate or adjusted for covariates); freqlist(), a powerful frequency table across many categorical variables; comparedf(), a function for comparing data.frames; and write2(), a function to output tables to a document.
- **Suggests** broom (>= 0.7.1), magrittr, rmarkdown, testthat, xtable, pander, survival (>= 2.43-1), coin, pROC, MASS, splines, rpart, yaml, geepack

Depends R (>= 3.4.0), stats (>= 3.4.0)

Imports knitr (>= 1.29), utils (>= 3.4.0)

An Arsenal of 'R' Functions for Large-Scale Statistical Summaries

Description

An Arsenal of 'R' functions for large-scale statistical summaries, which are streamlined to work within the latest reporting tools in 'R' and 'RStudio' and which use formulas and versatile summary statistics for summary tables and models.

Details

The package download, NEWS, and README are available on CRAN: https://cran.r-project.org/package=arsenal

Functions

Below are listed some of the most widely used functions available in arsenal:

tableby: Summary statistics of a set of independent variables by a categorical variable.

paired: Summary statistics of a set of independent variables paired across two timepoints.

modelsum: Fit models over each of a set of independent variables with a response variable.

freqlist: Approximate the output from SAS's PROC FREQ procedure when using the /list option
of the TABLE statement.

comparedf: Compare two data.frames and report any differences between them, much like SAS's PROC COMPARE procedure.

write2word, write2html, write2pdf: Functions to output tables to a single Word, HTML, or PDF document.

write2: Functions to output tables to a single document. (Also the S3 backbone behind the write2* functions.)

keep.labels: Keep the 'label' attribute on an R object when subsetting.

formulize: A shortcut to generate one-, two-, or many-sided formulas.

mdy.Date and Date.mdy: Convert numeric dates for month, day, and year to Date object, and vice versa.

is.Date: Test if an object is a date.

%nin%: Test for "not in".

allNA and includeNA: some useful functions for dealing with NAs.

Data

mockstudy: Mock study data for examples.

Examples

library(arsenal)

arsenal-defunct *Defunct functions in* arsenal

Description

Details about defunct functions in arsenal

Arguments

х, у	See comparedf.
	Other arguments.

Details

comparison.control was renamed to comparedf.control in version 3.0.0.

compare.data.frame was renamed to comparedf in version 3.0.0.

length.tableby was removed in version 2.0.0.

includeNA.character and includeNA.numeric were removed in version 2.0.0 and replaced with a default method.

rangeTime was removed in version 1.5.0.

arsenal_table arsenal *tables with common structure*

Description

arsenal tables with common structure

Usage

```
has_strata(x)
## S3 method for class 'arsenal_table'
x[i, j, ...]
## S3 method for class 'arsenal_table'
labels(object, ...)
## S3 replacement method for class 'arsenal_table'
labels(x) <- value</pre>
## S3 method for class 'arsenal_table'
print(x, ...)
## S3 method for class 'arsenal_table'
merge(x, y, all = FALSE, all.x = all, all.y = all, ...)
## S3 method for class 'freqlist'
merge(x, y, all = TRUE, ...)
## S3 method for class 'summary.arsenal_table'
print(
 х,
  ...,
  format = if (!is.null(x$text) && x$text %in% c("html", "latex")) x$text else
```

```
"markdown",
escape = x$text %nin% c("html", "latex"),
width = NULL,
min.split = NULL
)
```

Arguments

x,y,object	An object of class "arsenal_table"
i,j	A vector to index x with: either names of variables, a numeric vector, or a logical vector of appropriate length. i indexes the x-variables, and j indexes the by-variables.
	Other arguments (only used in print.summary.arsenal_table)
value A list of new labels. all, all.x, all.y	
	Logicals, denoting which terms to keep if not all are in common.
format	Passed to kable: the format for the table. The default here is "markdown". To use the default in kable, pass NULL. If x\$text specifies LaTeX or HTML formatting, that format is used in the table.
escape	Passed to kable: should special characters be escaped when printed?
width, min.split	
	Passed to smart.split for formatting of the "term" column.

See Also

merge, labels

as.data.frame.freqlist

as.data.frame.freqlist

Description

Convert freqlist object to a data.frame.

Usage

```
## S3 method for class 'freqlist'
as.data.frame(x, ..., labelTranslations = NULL, list.ok = FALSE)
```

Arguments

х	An object of class "freqlist".
	Arguments to pass to freq.control
labelTranslatio	ns
	A named list (or vector) where the name is the label in the output to be replaced in the pretty rendering by the character string value for the named element of the list, e.g., list(age = "Age(Years)", meansd = "Mean(SD)").
list.ok	If the object has multiple by-variables, is it okay to return a list of data.frames instead of a single data.frame? If FALSE but there are multiple by-variables, a warning is issued.

Value

A data.frame corresponding to the freqlist object.

as.data.frame.modelsum

as.data.frame.modelsum

Description

Coerce a modelsum object to a data.frame.

Usage

```
## S3 method for class 'modelsum'
as.data.frame(x, ..., labelTranslations = NULL, list.ok = FALSE)
```

Arguments

х	A modelsum object.
	Arguments to pass to modelsum.control.
labelTranslatio	ons
	A named list (or vector) where the name is the label in the output to be replaced in the pretty rendering by the character string value for the named element of the list, e.g., list(age = "Age(Years)", meansd = "Mean(SD)").
list.ok	If the object has multiple by-variables, is it okay to return a list of data.frames instead of a single data.frame? If FALSE but there are multiple by-variables, a warning is issued.

Value

A data.frame.

Author(s)

Ethan Heinzen, based on code originally by Greg Dougherty

modelsum, summary.modelsum

as.data.frame.tableby as.data.frame.tableby

Description

Coerce a tableby object to a data.frame.

Usage

```
## S3 method for class 'tableby'
as.data.frame(x, ..., labelTranslations = NULL, list.ok = FALSE)
```

Arguments

х	A tableby object.	
	Arguments to pass to tableby.control.	
labelTranslations		
	A named list (or vector) where the name is the label in the output to be replaced in the pretty rendering by the character string value for the named element of the list, e.g., list(age = "Age(Years)", meansd = "Mean(SD)").	
list.ok	If the object has multiple by-variables, is it okay to return a list of data.frames instead of a single data.frame? If FALSE but there are multiple by-variables, a warning is issued.	

Value

A data.frame.

Author(s)

Ethan Heinzen, based on code originally by Greg Dougherty

tableby, tableby

comparedf

Description

Compare two data.frames and report any differences between them, much like SAS's PROC COMPARE procedure.

Usage

```
comparedf(x, y, by = NULL, by.x = by, by.y = by, control = NULL, ...)
```

S3 method for class 'comparedf'
print(x, ...)

Arguments

х, у	A data.frame to compare
by, by.x, by.y	Which variables are IDs to merge the two data.frames? If set to "row.names", merging will occur over the row.names. If set to NULL (default), merging will occur row-by-row.
control	A list of control parameters from comparedf.control.
	Other arguments, passed to comparedf.control when appropriate.

Author(s)

Ethan Heinzen, adapted from code from Andrew Hanson

See Also

summary.comparedf, comparedf.control, diffs, n.diffs, n.diff.obs

Examples

comparedf.control *Control settings for* comparedf *function*

Description

Control tolerance definitions for the comparedf function.

Usage

```
comparedf.control(
  tol.logical = "none",
  tol.num = c("absolute", "percent", "pct"),
  tol.num.val = sqrt(.Machine$double.eps),
  int.as.num = FALSE,
  tol.char = c("none", "trim", "case", "both"),
  tol.factor = c("none", "levels", "labels"),
  factor.as.char = FALSE,
  tol.date = "absolute",
  tol.date.val = 0,
  tol.other = "none",
  tol.vars = "none",
 max.print.vars = NA,
 max.print.obs = NA,
 max.print.diffs.per.var = 10,
 max.print.diffs = 50,
 max.print.attrs = NA,
  ...,
 max.print.diff = 10
)
```

Arguments

<pre>tol.logical, tol.num, tol.char, tol.factor, tol.date, tol.other</pre>		
	A function or one of the shortcut character strings or a list thereof, denoting the tolerance function to use for a given data type. See "details", below.	
tol.num.val	Numeric; maximum value of differences allowed in numerics (fed to the func- tion given in tol.num).	
int.as.num	Logical; should integers be coerced to numeric before comparison? Default FALSE.	
factor.as.char	Logical; should factors be coerced to character before comparison? Default FALSE.	
tol.date.val	Numeric; maximum value of differences allowed in dates (fed to the function given in tol.date).	
tol.vars	Either "none" (the default), denoting that variable names are to be matched as- is, a named vector manually specifying variable names to compare (where the	

	names correspond to columns of x and the values correspond to columns of y), or a character vector denoting equivalence classes for characters in the variable names. See "details", below.	
<pre>max.print.vars</pre>	Integer denoting maximum number of variables to report in the "variables not shared" and "variables not compared" output. NA will print all differences.	
<pre>max.print.obs</pre>	Integer denoting maximum number of not-shared observations to report. NA will print all differences.	
max.print.diffs.per.var, max.print.diffs		
	Integers denoting the maximum number of differences to report for each variable or overall. NA will print all differences for each variable or overall.	
max.print.attrs		
	Integers denoting the maximum number of non-identical attributes to report.NA will print all differences.	
	Other arguments (not in use at this time).	
max.print.diff	Deprecated.	

Details

The following character strings are accepted:

- tol.logical = "none": compare logicals exactly as they are.
- tol.num = "absolute": compare absolute differences in numerics.

- tol.num = "percent", tol.num = "pct" compare percent differences in numerics.
- tol.char = "none": compare character strings exactly as they are.
- tol.char = "trim": left-justify and trim all trailing white space.
- tol.char = "case": allow differences in upper/lower case.
- tol.char = "both": combine "trim" and "case".
- tol.factor = "none": match both character labels and numeric levels.
- tol.factor = "levels": match only the numeric levels.
- tol.factor = "labels": match only the labels.
- tol.date = "absolute": compare absolute differences in dates.
- tol.other = "none": expect objects of other classes to be exactly identical.

A list with names mapped to x can be used to specify tolerances by variable. One unnamed element is supported as the default.

tol.vars: If not set to "none" (the default) or a named vector, the tol.vars argument is a character vector denoting equivalence classes for the characters in the variable names. A single character in this vector means to replace that character with "". All other strings in this vector are split by character and replaced by the first character in the string.

E.g., a character vector c("._", "aA", "") would denote that the dot and underscore are equivalent (to be translated to a dot), that "a" and "A" are equivalent (to be translated to "a"), and that spaces should be removed.

The special character string "case" in this vector is the same as specifying paste0(letters, LETTERS).

A list containing the necessary parameters for the comparedf function.

Author(s)

Ethan Heinzen

See Also

comparedf, comparedf.tolerances, summary.comparedf

Examples

comparedf.tolerances comparedf tolerances

Description

Internal functions defining tolerances for the comparedf.control function. To create your own tolerance definitions, see the vignette.

Usage

tol.NA(x, y, idx)
tol.num.absolute(x, y, tol)
tol.num.percent(x, y, tol)
tol.num.pct(x, y, tol)
tol.factor.none(x, y)
tol.factor.levels(x, y)

tol.factor.labels(x, y)
tol.char.both(x, y)
tol.char.case(x, y)
tol.char.trim(x, y)
tol.char.none(x, y)
tol.date.absolute(x, y, tol)
tol.logical.none(x, y)
tol.other.none(x, y)

Arguments

х, у	vectors of the appropriate lengths and types.
idx	A logical vector of appropriate length.
tol	A numeric tolerance

Details

tol.NA takes as differences between two vectors any elements which are NA in one but not the other, or which are non-NA in both and TRUE in idx. It is useful for handling NAs in custom tolerance functions.

Value

A logical vector of length equal to that of x and y, where TRUE denotes a difference between x and y, and FALSE denotes no difference between x and y.

Author(s)

Ethan Heinzen

See Also

comparedf.control, comparedf

diffs

Description

Extract differences (diffs()), number of differences (n.diffs()), or number of not-shared observations (n.diff.obs()) from a compared f object.

Usage

```
n.diff.obs(object, ...)
## S3 method for class 'comparedf'
n.diff.obs(object, ...)
## S3 method for class 'summary.comparedf'
n.diff.obs(object, ...)
n.diffs(object, ...)
## S3 method for class 'comparedf'
n.diffs(object, ...)
## S3 method for class 'summary.comparedf'
n.diffs(object, ...)
diffs(object, ...)
## S3 method for class 'comparedf'
diffs(
 object,
 what = c("differences", "observations"),
 vars = NULL,
  . . . ,
 by.var = FALSE
)
## S3 method for class 'summary.comparedf'
diffs(
 object,
 what = c("differences", "observations"),
 vars = NULL,
  . . . ,
 by.var = FALSE
)
```

formulize

Arguments

object	An object of class comparedf or summary.comparedf.
	Other arguments (not in use at this time).
what	Should differences or the not-shared observations be returned?
vars	A character vector of variable names to subset the results to.
by.var	Logical: should the number of differences by variable be reported, or should all differences be reported (the default).

Author(s)

Ethan Heinzen

See Also

comparedf summary.comparedf

|--|

Description

A shortcut to generate one-, two-, or many-sided formulas from vectors of variable names.

Usage

```
formulize(
 y = "",
 x = "",
 ...,
 data = NULL,
 collapse = "+",
 collapse.y = collapse,
 escape = FALSE
)
```

Arguments

y, x,	Character vectors, names, or calls to be collapsed (by "+") and put left-to-right in the formula. If data is supplied, these can also be numeric, denoting which column name to use. See examples.
data	An R object with non-null column names.
collapse	How should terms be collapsed? Default is addition.
collapse.y	How should the y-terms be collapsed? Default is addition. Also accepts the spe- cial string "list", which combines them into a multiple-left-hand-side formula, for use in other functions.
escape	A logical indicating whether character vectors should be coerced to names (that is, whether names with spaces should be surrounded with backticks or not)

Author(s)

Ethan Heinzen

See Also

reformulate

Examples

```
## two-sided formula
f1 <- formulize("y", c("x1", "x2", "x3"))</pre>
## one-sided formula
f2 <- formulize(x = c("x1", "x2", "x3"))</pre>
## multi-sided formula
f3 <- formulize("y", c("x1", "x2", "x3"), c("z1", "z2"), "w1")
## can use numerics for column names
data(mockstudy)
f4 <- formulize(y = 1, x = 2:4, data = mockstudy)</pre>
## mix and match
f5 <- formulize(1, c("x1", "x2", "x3"), data = mockstudy)</pre>
## get an interaction
f6 <- formulize("y", c("x1*x2", "x3"))</pre>
## get only interactions
f7 <- formulize("y", c("x1", "x2", "x3"), collapse = "*")</pre>
## no intercept
f8 <- formulize("y", "x1 - 1")
f9 <- formulize("y", c("x1", "x2", "-1"))</pre>
## LHS as a list to use in arsenal functions
f10 <- formulize(c("y1", "y2", "y3"), c("x", "z"), collapse.y = "list")</pre>
## use in an lm
f11 <- formulize(2, 3:4, data = mockstudy)</pre>
summary(lm(f11, data = mockstudy))
## using non-syntactic names or calls (like reformulate example)
f12 <- formulize(as.name("+-"), c("`P/E`", "`% Growth`"))</pre>
f12 <- formulize("+-", c("P/E", "% Growth"), escape = TRUE)</pre>
f <- Surv(ft, case) ~ a + b</pre>
f13 <- formulize(f[[2]], f[[3]])</pre>
```

freq.control

Description

Control test and summary settings for the freqlist function.

Usage

```
freq.control(
  sparse = FALSE,
  single = FALSE,
  dupLabels = FALSE,
  digits.count = 0L,
  digits.pct = 2L,
  ...,
  digits = NULL
)
```

Arguments

sparse	a logical value indicating whether to keep rows with counts of zero. The default is FALSE (drop zero-count rows).
single	logical, indicating whether to collapse results created using a strata variable into a single table for printing
dupLabels	logical: should labels which are the same as the row above be printed? The default (FALSE) more closely approximates PROC FREQ output from SAS, where a label carried down from the row above is left blank.
digits.count	Number of decimal places for count values.
digits.pct	Number of decimal places for percents.
	additional arguments.
digits	A deprecated argument

Value

A list with settings to be used within the freqlist function.

Author(s)

Ethan Heinzen

See Also

freqlist, summary.freqlist, freqlist.internal

freqlist

Description

Approximate the output from SAS's PROC FREQ procedure when using the /list option of the TABLE statement.

Usage

```
freqlist(object, ...)
## S3 method for class 'table'
freqlist(
 object,
 na.options = c("include", "showexclude", "remove"),
  strata = NULL,
  labelTranslations = NULL,
  control = NULL,
  . . .
)
## S3 method for class 'formula'
freqlist(
  formula,
 data,
  subset,
 na.action,
 na.options = c("include", "showexclude", "remove"),
  strata = NULL,
  labelTranslations = NULL,
  control = NULL,
  addNA,
  exclude,
 drop.unused.levels,
  . . .
)
```

Arguments

object	An R object, usually of class "table" or class "xtabs"
	additional arguments. In the formula method, these are passed to the table method. These are also passed to freq.control
na.options	a character string indicating how to handling missing values: "include" (in- clude values with NAs in counts and percentages), "showexclude" (show NAs but exclude from cumulative counts and all percentages), "remove" (remove values with NAs); default is "include".

freqlist.internal

strata	(formerly groupBy) an optional character string specifying a variable(s) to use	
	for grouping when calculating cumulative counts and percentages. summary.freqlist	
	will also separate by grouping variable for printing. Note that this is different	
	from modelsum and tableby, which take bare column names (and only one, at	
	that!)	
labelTranslations		
	an optional character string (or list) of labels to use for variable levels when summarizing. Names will be matched appropriately.	
control	control parameters to handle optional settings within freqlist. See freq.control	
formula, data,	subset, na.action, addNA, exclude, drop.unused.levels Arguments passed to xtabs.	

Value

An object of class c("freqlist", "arsenal_table")

Author(s)

Tina Gunderson, with revisions by Ethan Heinzen

See Also

arsenal_table, summary.freqlist, freq.control, freqlist.internal, table, xtabs

Examples

```
# load mockstudy data
data(mockstudy)
tab.ex <- table(mockstudy[c("arm", "sex", "mdquality.s")], useNA = "ifany")
noby <- freqlist(tab.ex, na.options = "include")
summary(noby)
# show the top 6 rows' frequencies and percents
head(summary(sort(noby, decreasing = TRUE)[c(1:4, 6)]))
withby <- freqlist(tab.ex, strata = c("arm", "sex"), na.options = "showexclude")
summary(withby)</pre>
```

freqlist.internal Helper functions for freqlist

Description

A set of helper functions for freqlist.

Usage

```
is.freqlist(x)
is.summary.freqlist(x)
## S3 method for class 'summary.freqlist'
head(x, n = 6L, ...)
## S3 method for class 'summary.freqlist'
tail(x, n = 6L, ...)
## S3 method for class 'freqlist'
sort(x, decreasing = FALSE, ...)
```

Arguments

х	A freqlist object.
n	A single integer. See head or tail for more details
	Other arguments.
decreasing	Should the sort be increasing or decreasing?

Details

Note that sort() has to recalculate cumulative statistics. Note also that the reordering of rows will also affect which labels are duplicates; you may also want to consider using dupLabels=TRUE in freq.control().

See Also

merge.freqlist, arsenal_table, sort, freqlist, summary.freqlist, freq.control,

internal.functions Internal Functions

Description

Internal Functions

Usage

```
smart.split(string, width = Inf, min.split = -Inf)
```

replace2(x, list, values)

20

keep.labels

Arguments

string	A character vector
width	Either Inf or NULL to specify no splitting, or a positive integer giving the largest allowed string length.
min.split	Either -Inf or NULL to specify no lower bound on the string length, or a positive integer giving the minimum string length.
х	vector
list	an index vector
values	replacement values

Value

For smart.split, a list of the same length as string, with each element being the "intelligently" split string.

For replace2, a vector with the proper values replaced.

Keep Labels

See Also

replace

keep.labels

Description

Keep the 'label' attribute on an R object when subsetting. loosen.labels allows the 'label' attribute to be lost again.

Usage

```
keep.labels(x, ...)
## S3 method for class 'data.frame'
keep.labels(x, ...)
## Default S3 method:
keep.labels(x, ...)
## S3 method for class 'keep_labels'
x[...]
## S3 replacement method for class 'keep_labels'
x[i] <- value
loosen.labels(x, ...)</pre>
```

```
## S3 method for class 'data.frame'
loosen.labels(x, ...)
## Default S3 method:
loosen.labels(x, ...)
```

Arguments

х	An R object
	Other arguments (not in use at this time).
i, value	See [<

Value

A copy of x with a "keep_labels" class appended on or removed. Note that for the data.frame method, only classes on the columns are changed; the data.frame won't have an extra class appended. This is different from previous versions of arsenal.

Author(s)

Ethan Heinzen

See Also

labels

labels	Labels		

Description

Assign and extract the 'label' attribute on an R object. set_labels is the same as labels(x) <- value but returns x for use in a pipe chain. set_attr is the same as attr(x, which) <- value but returns x for use in a pipe chain.

Usage

```
## S3 method for class 'data.frame'
labels(object, ...)
## S3 method for class 'keep_labels'
labels(object, ...)
labels(x) <- value
## S3 replacement method for class 'keep_labels'</pre>
```

mdy.Date

```
labels(x) <- value
## Default S3 replacement method:
labels(x) <- value
## S3 replacement method for class 'data.frame'
labels(x) <- value
set_labels(x, value)
set_attr(x, which, value)</pre>
```

Arguments

	Other arguments (not in use at this time).
x, object	An R object.
value	A vector or list containing labels to assign. Labels are assigned based on names, if available; otherwise, they're assigned in order. Can pass NULL to remove all labels.
which	See attr<-

Details

The data.frame methods put labels on and extract labels from the *columns* of object.

Value

The labels of object, or object with new labels.

Author(s)

Ethan Heinzen

See Also

keep.labels

mdy.Date

Convert numeric dates to Date object, and vice versa

Description

Convert numeric dates for month, day, and year to Date object, and vice versa.

Usage

```
mdy.Date(month, day, year, yearcut = 120)
Date.mdy(date)
is.Date(x)
```

Arguments

month	integer, month (1-12).
day	integer, day of the month (1-31, depending on the month).
year	integer, either 2- or 4-digit year. If two-digit number, will add 1900 onto it, depending on range.
yearcut	cutoff for method to know if to convert to 4-digit year.
date	A date value.
x	An object.

Details

Test if an object is a date.

More work may need to be done with yearcut and 2-digit years. Best to give a full 4-digit year.

Value

mdy.Date returns a Date object, and Date.mdy returns a list with integer values for month, day, and year. is.Date returns a single logical value.

See Also

Date, DateTimeClasses

Examples

mdy.Date(9, 2, 2013)

tmp <- mdy.Date(9, 2, 2013)
Date.mdy(tmp)</pre>

is.Date(tmp)

 ${\tt mockstudy}$

Description

Mock clinical study data for examples to test data manipulation and statistical functions. The function muck_up_mockstudy() is used in examples for comparedf.

Usage

mockstudy

muck_up_mockstudy()

Format

A data frame with 1499 observations on the following 15 variables:

case a numeric identifier-patient ID

age age in years

arm treatment arm divided into 3 groups, character string

sex a factor with levels Male Female

race self-reported race/ethnicity, character string

fu.time survival or censoring time in years

fu.stat censoring status; 1=censor, 2=death

ps integer, ECOG performance score

hgb numeric, hemoglobin count

bmi numeric, body mass index, kg/m^2

alk.phos numeric, alkaline phosphatase

ast numeric, aspartate transaminase

mdquality.s integer, LASA QOL 0=Clinically Deficient, 1=Not Clinically Deficient

age.ord an ordered factor split of age, with levels 10-19 < 20-29 < 30-39 < 40-49 < 50-59 < 60-69 < 70-79 < 80-89

An object of class data. frame with 1499 rows and 14 columns.

Examples

data(mockstudy)
str(mockstudy)

modelsum

Description

Fit and summarize models for each independent (x) variable with a response variable (y), with options to adjust by variables for each model.

Usage

```
modelsum(
   formula,
   family = "gaussian",
   data,
   adjust = NULL,
   na.action = NULL,
   subset = NULL,
   weights = NULL,
   id,
   strata,
   control = NULL,
   ...
)
```

Arguments

formula	an object of class formula; a symbolic description of the variables to be mod- eled. See "Details" for more information.
family	similar mechanism to glm, where the model to be fit is driven by the family. Op- tions include: binomial, gaussian, survival, poisson, negbin, clog, and ordinal. These can be passed as a string, as a function, or as a list resulting from a call to one of the functions. See modelsum.family for details on survival, ordinal, negbin, and clog families.
data	an optional data.frame, list or environment (or object coercible by as.data.frame to a data frame) containing the variables in the model. If not found in data, the variables are taken from environment(formula), typically the environment from which modelsum is called.
adjust	an object of class formula or a list of formulas, listing variables to adjust by in all models. Specify as a one-sided formula, like: ~Age+ Sex. If a list, the names are used for the summary function. Unadjusted models can be specified as ~ 1 or as a list: list(Unadjusted = NULL).
na.action	a function which indicates what should happen when the data contain NAs. The default (NULL) is to use the defaults of lm , glm , or coxph, depending on the family specifications.

modelsum

subset	an optional vector specifying a subset of observations (rows of data) to be used in the results. If strata is missing, this works as vector of logicals or an index; otherwise, it should be a logical vector.
weights	an optional vector specifying the weights to apply to each data observation (rows of data)
id	A vector to identify clusters. Only used for relrisk at this time.
strata	a vector of strata to separate model summaries by an additional group. Note that for families like "clog", the "usual" strata term to indicate subject groupings should be given in the adjust argument.
control	control parameters to handle optional settings within modelsum. Arguments for modelsum.control can be passed to modelsum via the argument, but if a control object and arguments are both supplied, the latter are used. See modelsum.control for other details.
	additional arguments to be passed to internal modelsum functions.

Value

An object with class c("modelsum", "arsenal_table")

Author(s)

Jason Sinnwell, Patrick Votruba, Beth Atkinson, Gregory Dougherty, and Ethan Heinzen, adapted from SAS Macro of the same name

See Also

arsenal_table, modelsum.control, summary.modelsum, modelsum.internal, formulize

Examples

modelsum.control

Description

Control test and summary settings for modelsum function.

Usage

```
modelsum.control(
  digits = 3L,
  digits.ratio = 3L,
  digits.p = 3L,
  format.p = TRUE,
  show.adjust = TRUE,
  show.intercept = TRUE,
  conf.level = 0.95,
  ordinal.stats = c("OR", "CI.lower.OR", "CI.upper.OR", "p.value", "Nmiss"),
 binomial.stats = c("OR", "CI.lower.OR", "CI.upper.OR", "p.value", "concordance",
    "Nmiss"),
 gaussian.stats = c("estimate", "std.error", "p.value", "adj.r.squared", "Nmiss"),
  poisson.stats = c("RR", "CI.lower.RR", "CI.upper.RR", "p.value", "Nmiss"),
  negbin.stats = c("RR", "CI.lower.RR", "CI.upper.RR", "p.value", "Nmiss"),
 relrisk.stats = c("RR", "CI.lower.RR", "CI.upper.RR", "p.value", "Nmiss"),
 clog.stats = c("OR", "CI.lower.OR", "CI.upper.OR", "p.value", "concordance", "Nmiss"),
 survival.stats = c("HR", "CI.lower.HR", "CI.upper.HR", "p.value", "concordance",
    "Nmiss"),
  stat.labels = list(),
```

)

Arguments

digits	Numeric, denoting the number of digits after the decimal point for beta coefficients and standard errors.
digits.ratio	Numeric, denoting the number of digits after the decimal point for ratios, e.g. OR, RR, HR.
digits.p	Numeric, denoting the number of digits for p-values. See "Details", below.
format.p	Logical, denoting whether to format p-values. See "Details", below.
show.adjust	Logical, denoting whether to show adjustment terms.
show.intercept	Logical, denoting whether to show intercept terms.
conf.level	Numeric, giving the confidence level.
ordinal.stats,	binomial.stats, survival.stats, gaussian.stats, poisson.stats, negbin.stats, clog.stats Character vectors denoting which stats to show for the various model types.
stat.labels	A named list of labels for all the stats used above.
	Other arguments (not in use at this time).

modelsum.family

Details

If format.p is FALSE, digits.p denotes the number of significant digits shown. The p-values will be in exponential notation if necessary. If format.p is TRUE, digits.p will determine the number of digits after the decimal point to show. If the p-value is less than the resulting number of places, it will be formatted to show so.

Value

A list with settings to be used within the model sum function.

See Also

modelsum, summary.modelsum, modelsum.internal

modelsum.family Family functions for modelsum

Description

A set of family functions for modelsum.

Usage

```
survival()
```

```
ordinal(method = c("logistic", "probit", "loglog", "cloglog", "cauchit"))
```

```
negbin(link = c("log", "identity", "sqrt"))
```

clog()

relrisk(link = "log")

Arguments

method	See MASS::polr.
link	See MASS::glm.nb.

Value

A list, in particular with element family.

See Also

family, coxph, polr

modelsum.internal Helper functions for modelsum

Description

A set of helper functions for modelsum.

Usage

is.modelsum(x)

is.summary.modelsum(x)

na.modelsum(object, ...)

Arguments

Х	A modelsum object.
object	A data.frame resulting from evaluating a modelsum formula.
	Other arguments, or a vector of indices for extracting.

Value

na.modelsum returns a subsetted version of object (with attributes).

See Also

arsenal_table

NA. operations Some functions to handle NAs

Description

allNA tests if all elements are NA, and includeNA sets the NAs in a character vector or factor to an explicit label.

Usage

```
allNA(x)
includeNA(x, label, ...)
## S3 method for class 'factor'
includeNA(x, label = "(Missing)", first = FALSE, ...)
## Default S3 method:
includeNA(x, label = "(Missing)", ...)
```

padjust

Arguments

х	An object
label	A character string denoting the label to set NAs to.
	Other arguments (not in use at this time).
first	Logical; should the new label be the first level?

Author(s)

Ethan Heinzen

See Also

is.na, anyNA

padjust

Adjust P-values for Multiple Comparisons

Description

Adjust P-values for Multiple Comparisons

Usage

```
padjust(p, method, n, ...)
## Default S3 method:
padjust(p, method, n, ...)
## S3 method for class 'tableby'
padjust(p, method, n, suffix = " (adjusted for multiple comparisons)", ...)
## S3 method for class 'summary.tableby'
```

padjust(p, method, n, suffix = " (adjusted for multiple comparisons)", ...)

Arguments

р	An object.
method	correction method. Can be abbreviated.
n	number of comparisons, must be at least length(p); only set this (to non-default) when you know what you are doing!
	Other arguments.
suffix	A suffix to add to the footnotes indicating that the tests were adjusted.

See Also

p.adjust, modpval.tableby, tests.tableby

paired

Summary Statistics of a Set of Independent Variables Paired Across Two Timepoints

Description

Summarize one or more variables (x) by a paired time variable (y). Variables on the right side of the formula, i.e. independent variables, are summarized by the two time points on the left of the formula. Optionally, an appropriate test is performed to test the distribution of the independent variables across the time points.

Usage

```
paired(
  formula,
  data,
  id,
  na.action,
  subset = NULL,
  strata,
  control = NULL,
  ...
)
```

Arguments

formula	an object of class formula of the form time ~ var1 + See "Details" for more information.
data	an optional data frame, list or environment (or object coercible by as.data.frame to a data frame) containing the variables in the model. If not found in data, the variables are taken from environment(formula), typically the environment from which the function is called.
id	The vector giving IDs to match up data for the same subject across two time- points.
na.action	a function which indicates what should happen when the data contain NAs. The default is na.paired("in.both"). See na.paired for more details
subset	an optional vector specifying a subset of observations (rows of data) to be used in the results. Works as vector of logicals or an index.
strata	a vector of strata to separate summaries by an additional group.
control	control parameters to handle optional settings within paired. Two aspects of paired are controlled with these: test options of RHS variables and x variable summaries. Arguments for paired.control can be passed to paired via the argument, but if a control object and arguments are both supplied, the latter are used. See paired.control for more details.
	additional arguments to be passed to internal paired functions or paired.control.

paired.control

Details

Do note that this function piggybacks off of tableby quite heavily, so there is no summary.paired function (for instance).

These tests are accepted:

- paired.t: a paired t-test.
- mcnemar: McNemar's test.
- signed.rank: a signed rank test.
- sign.test: a sign test.
- notest: no test is performed.

Value

```
An object with class c("paired", "tableby", "arsenal_table")
```

Author(s)

Jason Sinnwell, Beth Atkinson, Ryan Lennon, and Ethan Heinzen

See Also

arsenal_table, paired.control, tableby, formulize, selectall

paired.control Control settings for paired function

Description

Control test and summary settings for the paired function.

Usage

```
paired.control(
  diff = TRUE,
  numeric.test = "paired.t",
   cat.test = "mcnemar",
   ordered.test = "signed.rank",
   date.test = "paired.t",
   mcnemar.correct = TRUE,
   signed.rank.exact = NULL,
   signed.rank.correct = TRUE,
   ...
)
```

Arguments

diff	logical, telling paired whether to calculate a column of differences between time points.
numeric.test	name of test for numeric RHS variables in paired: paired.t, signed.rank, sign.test.
cat.test	name of test for categorical variables: mcnemar
ordered.test	name of test for ordered variables: signed.rank, sign.test
date.test	name of test to perform for date variables: paired.t, signed.rank, sign.test
<pre>mcnemar.correct, signed.rank.exact, signed.rank.correct</pre>	
	Options for statistical tests. See wilcox.test and mcnemar.test for details.
	Arguments passed to tableby.control

Details

Note that (with the exception of total) all arguments to tableby.control are accepted in this function (in fact, this function passes everything through to tableby.control). However, there are different defaults for the statistical tests (shown here). For details on the other arguments, please see the help page for tableby.control.

Value

A list with settings to be used within the paired function.

Author(s)

Ethan Heinzen

See Also

paired, tableby, tableby.control, summary.tableby

paired.internal Helper functions for paired

Description

A set of helper functions for paired.

Usage

```
na.paired(missings = c("in.both", "fill", "asis"))
```

Arguments

missings A character string denoting which action to take. See "Details", below.

selectall

Details

All methods subset out any NA time points or IDs. "in.both" (the default) subsets the data.frame to individuals who appear at both time points. "fill" adds explicit missings for the people missing second time points. "asis" does nothing to add or remove missings.

Value

na.paired returns a function used to subset data.frames in paired.

See Also

tableby.internal

selectall

Make a column for "select all" input

Description

Make a column for "select all" input

Usage

```
selectall(...)
as.selectall(x)
## S3 method for class 'selectall'
as.matrix(x, ...)
## S3 method for class 'selectall'
x[i, j, drop = FALSE]
## S3 method for class 'selectall'
is.na(x)
```

is.selectall(x)

Arguments

•••	Named arguments of the same length. These should be logical, numeric $(0/1)$ or
	a factor with two levels.
х	An object of class "selectall"
i,j,drop	Arguments to '[.matrix'

See Also

tableby, paired

Examples

```
d <- data.frame(grp = rep(c("A", "B"), each = 5))
d$s <- selectall(
    `Option 1` = c(rep(1, 4), rep(0, 6)),
    `Option 2` = c(0, 1, 0, 0, 0, 1, 1, 1, 0, 0),
    `Option 3` = 1,
    `Option 4` = 0
)
summary(tableby(grp ~ s, data = d), text = TRUE)</pre>
```

summary.comparedf *The summary method for a* comparedf *object*

Description

Print a more detailed output of the comparedf object.

Usage

```
## S3 method for class 'comparedf'
summary(object, ..., show.attrs = FALSE)
```

```
## S3 method for class 'summary.comparedf'
print(x, ..., format = "pandoc")
```

Arguments

object	An object of class "comparedf", as made by the comparedf S3 method.
	Other arguments passed to comparedf.control. In print, these are passed to kable.
show.attrs	Logical, denoting whether to show the actual attributes which are different. For (e.g.) factors with lots of levels, this can make the tables quite wide, so this feature is FALSE by default.
х	An object returned by the summary.comparedf function.
format	Passed to kable: the format for the table. The default here is "pandoc". To use the default in kable, pass NULL.

Value

An object of class "summary.comparedf" is returned.

See Also

comparedf, comparedf.control

36
summary.freqlist summary.freqlist

Description

Summarize the freqlist object.

Usage

```
## S3 method for class 'freqlist'
summary(object, ..., labelTranslations = NULL, title = NULL)
## S3 method for class 'summary.freqlist'
```

```
as.data.frame(x, ..., list.ok = FALSE)
```

Arguments

object	an object of class freqlist
	For summary.freqlist, these are passed to as.data.frame.freqlist (and hence to freq.control). For the print method, these are additional arguments passed to the kable function.
labelTranslatic	ns
	A named list (or vector) where the name is the label in the output to be replaced in the pretty rendering by the character string value for the named element of the list, e.g., list(age = "Age(Years)", meansd = "Mean(SD)").
title	Title/caption for the table, defaulting to NULL (no title). Passed to kable. Can be length > 1 if the more than one table is being printed.
x	An object of class summary.freqlist.
list.ok	If the object has multiple by-variables, is it okay to return a list of data.frames instead of a single data.frame? If FALSE but there are multiple by-variables, a warning is issued.

Value

An object of class "summary.freqlist" (invisibly for the print method).

Author(s)

Tina Gunderson, with major revisions by Ethan Heinzen

See Also

freqlist, table, xtabs, kable, freq.control, freqlist.internal

Examples

```
# load mockstudy data
data(mockstudy)
tab.ex <- table(mockstudy[c("arm", "sex", "mdquality.s")], useNA = "ifany")
noby <- freqlist(tab.ex, na.options = "include")
summary(noby)
withby <- freqlist(tab.ex, strata = c("arm", "sex"), na.options = "showexclude")
summary(withby)
summary(withby, dupLabels = TRUE)</pre>
```

summary.modelsum Summarize a modelsum object.

Description

Format the information in object as a table using Pandoc coding or plain text, and cat it to stdout.

Usage

```
## S3 method for class 'modelsum'
summary(
 object,
  . . . ,
  labelTranslations = NULL,
  text = FALSE,
  title = NULL,
  term.name = "",
  adjustment.names = FALSE
)
## S3 method for class 'summary.modelsum'
as.data.frame(
 х,
  ...,
 text = x$text,
  term.name = x$term.name,
  adjustment.names = x$adjustment.names,
 width = NULL,
 min.split = NULL,
  list.ok = FALSE
```

```
)
```

Arguments

object A modelsum object.

	For summary.modelsum, other arguments passed to as.data.frame.modelsum. For as.data.frame.summary.modelsum, "width" and "min.split" are passed to smart.split. For printing the summary object, these are passed to both as.data.frame.summary.modelsum and kable.	
labelTranslatio	ons	
	A named list (or vector) where the name is the label in the output to be replaced in the pretty rendering by the character string value for the named element of the list, e.g., list(age = "Age(Years)", meansd = "Mean(SD)").	
text	An argument denoting how to print the summary to the screen. Default is FA (show markdown output). TRUE and NULL output a text-only version, with latter avoiding all formatting. "html" uses the HTML tag instea the markdown formatting, and "latex" uses the LaTeX command \textbf	
title	Title/caption for the table, defaulting to NULL (no title). Passed to kable. Can be length > 1 if the more than one table is being printed.	
term.name	A character vector denoting the column name for the "terms" column. It should be the same length as the number of tables or less (it will get recycled if needed). The special value TRUE will use the y-variable's label for each table.	
adjustment.name	25	
	Logical, denoting whether the names of the adjustment models should be printed.	
x	An object of class "summary.modelsum".	
width	Passed to smart.split for formatting of the "term" column.	
min.split	Passed to smart.split for formatting of the "term" column.	
list.ok	If the object has multiple by-variables, is it okay to return a list of data.frames instead of a single data.frame? If FALSE but there are multiple by-variables, a warning is issued.	

Value

An object of class "summary.modelsum"

Author(s)

Ethan Heinzen, based on code originally by Greg Dougherty

See Also

modelsum, as.data.frame.modelsum

summary.tableby

Description

The summary method for a tableby object, which is a pretty rendering of a tableby object into a publication-quality results table in R Markdown, and can render well in text-only.

Usage

```
## S3 method for class 'tableby'
summary(
 object,
  ...,
 labelTranslations = NULL,
  text = FALSE,
  title = NULL,
 pfootnote = FALSE,
  term.name = ""
)
## S3 method for class 'summary.tableby'
as.data.frame(
 х,
  ...,
  text = x$text,
 pfootnote = x$pfootnote,
  term.name = x$term.name,
 width = NULL,
 min.split = NULL,
 list.ok = FALSE
)
```

object	An object of class "tableby", made by the tableby function.	
	For summary.tableby, other arguments passed to as.data.frame.tableby. For printing the summary object, these are passed to both as.data.frame.summary.tableby and kable.	
labelTranslati	labelTranslations	
	A named list (or vector) where the name is the label in the output to be replaced in the pretty rendering by the character string value for the named element of the list, e.g., list(age = "Age(Years)", meansd = "Mean(SD)").	
text	An argument denoting how to print the summary to the screen. Default is FALSE (show markdown output). TRUE and NULL output a text-only version, with the latter avoiding all formatting. "html" uses the HTML tag instead of the markdown formatting, and "latex" uses the LaTeX command \textbf.	

summary.tableby

title	Title/caption for the table, defaulting to NULL (no title). Passed to kable. Can be length > 1 if the more than one table is being printed.	
pfootnote	Logical, denoting whether to put footnotes describing the tests used to gener- ate the p-values. Alternatively, "html" to surround the outputted footnotes with <1i>.	
term.name	A character vector denoting the column name for the "terms" column. It should be the same length as the number of tables or less (it will get recycled if needed). The special value TRUE will use the y-variable's label for each table.	
х	An object of class "summary.tableby".	
width	Passed to smart.split for formatting of the "term" column.	
min.split	Passed to smart.split for formatting of the "term" column.	
list.ok	If the object has multiple by-variables, is it okay to return a list of data.frames instead of a single data.frame? If FALSE but there are multiple by-variables, a warning is issued.	

Value

An object of class summary.tableby

Author(s)

Ethan Heinzen, based on code by Gregory Dougherty, Jason Sinnwell, Beth Atkinson, adapted from SAS Macros written by Paul Novotny and Ryan Lennon

See Also

tableby.control, tableby

Examples

tableby

Summary Statistics of a Set of Independent Variables by a Categorical Variable

Description

Summarize one or more variables (x) by a categorical variable (y). Variables on the right side of the formula, i.e. independent variables, are summarized by the levels of a categorical variable on the left of the formula. Optionally, an appropriate test is performed to test the distribution of the independent variables across the levels of the categorical variable.

Usage

```
tableby(
  formula,
  data,
  na.action,
  subset = NULL,
  weights = NULL,
  strata,
  control = NULL,
  ...
)
```

formula	an object of class formula; a symbolic description of the variables to be sum- marized by the group, or categorical variable, of interest. See "Details" for more information. To only view overall summary statistics, a one-sided formula can be used.
data	an optional data frame, list or environment (or object coercible by as.data.frame to a data frame) containing the variables in the model. If not found in data, the variables are taken from environment(formula), typically the environment from which the function is called.
na.action	a function which indicates what should happen when the data contain NAs. The default is na.tableby(TRUE) if there is a by-variable, and na.tableby(FALSE) if there is not. This schema thus includes observations with NAs in x variables, but removes those with NA in the categorical group variable and strata (if used).
subset	an optional vector specifying a subset of observations (rows of data) to be used in the results. Works as vector of logicals or an index.
weights	a vector of weights. Using weights will disable statistical tests.
strata	a vector of strata to separate summaries by an additional group.
control	control parameters to handle optional settings within tableby. Two aspects of tableby are controlled with these: test options of RHS variables across levels of the categorical grouping variable, and x variable summaries within the grouping

tableby

variable. Arguments for tableby.control can be passed to tableby via the ... argument, but if a control object and ... arguments are both supplied, the latter are used. See tableby.control for more details.

... additional arguments to be passed to internal tableby functions or tableby.control.

Details

The group variable (if any) is categorical, which could be an integer, character, factor, or ordered factor. tableby makes a simple summary of the counts within the k-levels of the independent variables on the right side of the formula. Note that unused levels are dropped.

The data argument allows data.frames with label attributes for the columns, and those labels will be used in the summary methods for the tableby class.

The independent variables are a mixture of types: categorical (discrete), numeric (continuous), and time to event (survival). These variables are split by the levels of the group variable (if any), then summarized within those levels, specific to the variable type. A statistical test is performed to compare the distribution of the independent variables across the levels of the grouping variable.

The tests differ by the independent variable type, but can be specified explicitly in the formula statement or in the control function. These tests are accepted:

- anova: analysis of variance test; the default test for continuous variables. When LHS variable has two levels, equivalent to two-sample t-test.
- kwt: Kruskal-Wallis Rank Test, optional test for continuous variables. When LHS variable has two levels, equivalent to Wilcoxon test.
- wt: An explicit Wilcoxon test.
- medtest: A median test.
- chisq: chi-square goodness of fit test for equal counts of a categorical variable across categories; the default for categorical or factor variables
- · fe: Fisher's exact test for categorical variables
- trend: trend test for equal distribution of an ordered variable across a categorical variable; the default for ordered factor variables
- logrank: log-rank, the default for time-to-event variables
- notest: no test is performed.

To perform a mixture of asymptotic and rank-based tests on two different continuous variables, an example formula is: formula = group ~ anova(age) + kwt(height). The test settings in tableby.control apply to all independent variables of a given type.

The summary statistics reported for each independent variable within the group variable can be set in tableby.control.

Finally, multiple by-variables can be set using list(). See the examples for more details.

Value

An object with class c("tableby", "arsenal_table")

Author(s)

Jason Sinnwell, Beth Atkinson, Gregory Dougherty, and Ethan Heinzen, adapted from SAS Macros written by Paul Novotny and Ryan Lennon

tableby.control Control settings for tableby function

Description

Control test and summary settings for the tableby function.

Usage

```
tableby.control(
  test = TRUE,
  total = TRUE,
  total.pos = c("after", "before"),
  test.pname = NULL,
  numeric.simplify = FALSE,
  cat.simplify = FALSE,
  cat.droplevels = FALSE,
  ordered.simplify = FALSE,
  date.simplify = FALSE,
```

```
numeric.test = "anova",
cat.test = "chisq",
ordered.test = "trend",
surv.test = "logrank",
date.test = "kwt",
selectall.test = "notest",
test.always = FALSE,
numeric.stats = c("Nmiss", "meansd", "range"),
cat.stats = c("Nmiss", "countpct"),
ordered.stats = c("Nmiss", "countpct"),
surv.stats = c("Nmiss", "Nevents", "medSurv"),
date.stats = c("Nmiss", "median", "range"),
selectall.stats = c("Nmiss", "countpct"),
stats.labels = list(),
digits = 3L,
digits.count = 0L,
digits.pct = 1L,
digits.p = 3L,
format.p = TRUE,
digits.n = 0L,
conf.level = 0.95,
wilcox.correct = FALSE,
wilcox.exact = NULL,
chisq.correct = FALSE,
simulate.p.value = FALSE,
B = 2000,
times = 1:5,
. . .
```

```
)
```

test	logical, telling tableby whether to perform tests of x variables across levels of the group variable.
total	logical, telling tableby whether to calculate a column of totals across group variable.
total.pos	One of "before" or "after", denoting where to put the total column relative to the by-variable columns.
test.pname	character string denoting the p-value column name in summary.tableby. Mod- ifiable also with modpval.tableby.
numeric.simplif	y, date.simplify
	logical, tell tableby whether to condense numeric/date output to a single line. NOTE: this only simplifies to one line if there is only one statistic reported, such as meansd. In particular, if Nmiss is specified and there are missings, then the output is not simplified.
cat.simplify, o	rdered.simplify
	logical, tell tableby whether to remove the first level of the categorical/ordinal variable if binary. If TRUE, only the summary stats of the second level are re-

	ported (unless there's only one level, in which case it's reported). If "label", the second level's label is additionally appended to the label. NOTE: this only simplifies to one line if there is only one statistic reported, such as countpct. In particular, if Nmiss is specified and there are missings, then the output is not simplified.
cat.droplevels	Should levels be dropped for categorical variables? If set to true, p-values will not be displayed unless test.always = TRUE as well.
numeric.test	name of test for numeric RHS variables in tableby: anova, kwt (Kruskal-Wallis), medtest (median test). If no LHS variable exists, then a mean is required for a univariate test.
cat.test	name of test for categorical variables: chisq, fe (Fisher's Exact)
ordered.test	name of test for ordered variables: trend
surv.test	name of test for survival variables: logrank
date.test	name of test for date variables: kwt
selectall.test	name of test for date variables: notest
test.always	Should the test be performed even if one or more by-group has 0 observations? Relevant for kwt and anova.
numeric.stats, o	cat.stats, ordered.stats, surv.stats, date.stats, selectall.stats summary statistics to include for the respective class of RHS variables within the levels of the group LHS variable.
stats.labels	A named list of labels for all the statistics function names, where the function name is the named element in the list and the value that goes with it is a string containing the formal name that will be printed in all printed renderings of the output, e.g., list(countpct="Count (Pct)"). Any unnamed elements will be ignored. Passing NULL will disable labels.
digits	Number of decimal places for numeric values.
digits.count	Number of decimal places for count values.
digits.pct	Number of decimal places for percents.
digits.p	Number of decimal places for p-values.
format.p	Logical, denoting whether to format p-values. See "Details", below.
digits.n	Number of decimal places for N's in the header. Set it to NA to suppress the N's.
conf.level	Numeric, denoting what confidence level to use for confidence intervals. (See, e.g., binomCI)
wilcox.correct,	wilcox.exact See wilcox.test
chisq.correct	logical, correction factor for chisq.test
simulate.p.valu	
	logical, simulate p-value for categorical tests (fe and chisq)
В	number of simulations to perform for simulation-based p-value
times	A vector of times to use for survival summaries.
	additional arguments.

tableby.internal

Details

All tests can be turned off by setting test to FALSE. Otherwise, test are set to default settings in this list, or set explicitly in the formula of tableby.

If format.p is FALSE, digits.p denotes the number of significant digits shown. The p-values will be in exponential notation if necessary. If format.p is TRUE, digits.p will determine the number of digits after the decimal point to show. If the p-value is less than the resulting number of places, it will be formatted to show so.

Options for statistics are described more thoroughly in the vignette and are listed in tableby.stats

Value

A list with settings to be used within the tableby function.

Author(s)

Jason Sinnwell, Beth Atkinson, Ethan Heinzen, Terry Therneau, adapted from SAS Macros written by Paul Novotny and Ryan Lennon

anova, chisq.test, tableby, summary.tableby, tableby.stats.

Examples

tableby.internal *Helper functions for tableby*

Description

A set of helper functions for tableby.

Usage

```
is.tableby(x)
is.summary.tableby(x)
modpval.tableby(x, pdata, use.pname = FALSE)
tests(x)
## S3 method for class 'tableby'
tests(x)
na.tableby(lhs = TRUE)
## S3 method for class 'tableby'
xtfrm(x)
## S3 method for class 'tableby'
sort(x, ...)
## S3 method for class 'tableby'
Ops(e1, e2)
## S3 method for class 'tableby'
head(x, n = 6L, \ldots)
## S3 method for class 'tableby'
tail(x, n = 6L, \ldots)
```

Arguments

x	A tableby object.
pdata	A named data.frame where the first column is the by-variable names, the (optional) second is the strata value, the next is the x variable names, the next is p-values (or some test stat), and the (optional) next column is the method name.
use.pname	Logical, denoting whether the column name in pdata corresponding to the p-values should be used in the output of the object.
lhs	Logical, denoting whether to remove NAs from the first column of the data.frame (the "left-hand side")
	Other arguments.
e1, e2	tableby objects, or numbers to compare them to.
n	A single integer. See head or tail for more details

Details

Logical comparisons are implemented for Ops.tableby.

tableby.stats

Value

na.tableby returns a subsetted version of object (with attributes). Ops.tableby returns a logical vector. xtfrm.tableby returns the p-values (which are ordered by order to sort).

See Also

arsenal_table, sort, head, tail, tableby, summary.tableby, tableby.control

tableby.stats tableby Summary Statistics Functions

Description

A collection of functions that will report summary statistics. To create a custom function, consider using a function with all three arguments and See the tableby vignette for an example.

Usage

arsenal_sum(x, na.rm = TRUE, ...)
arsenal_min(x, na.rm = TRUE, ...)
arsenal_max(x, na.rm = TRUE, ...)
arsenal_mean(x, na.rm = TRUE, weights = NULL, ...)
arsenal_sd(x, na.rm = TRUE, weights = NULL, ...)
arsenal_var(x, na.rm = TRUE, weights = NULL, ...)
meansd(x, na.rm = TRUE, weights = NULL, ...)
meanse(x, na.rm = TRUE, weights = NULL, ...)
medianrange(x, na.rm = TRUE, weights = NULL, conf.level = 0.95, ...)
medianrange(x, na.rm = TRUE, weights = NULL, ...)
arsenal_median(x, na.rm = TRUE, weights = NULL, ...)
arsenal_median(x, na.rm = TRUE, weights = NULL, ...)
arsenal_median(x, na.rm = TRUE, weights = NULL, ...)
arsenal_range(x, na.rm = TRUE, weights = NULL, ...)
gmean(x, na.rm = TRUE, weights = NULL, ...)
gmean(x, na.rm = TRUE, weights = NULL, ...)
arsenal_range(x, na.rm = TRUE, weights = NULL, ...)

```
gmeansd(x, na.rm = TRUE, weights = NULL, ...)
gmeanCI(x, na.rm = TRUE, weights = NULL, conf.level = 0.95, ...)
Nsigntest(x, na.rm = TRUE, weights = NULL, ...)
Nevents(x, na.rm = TRUE, weights = NULL, ...)
medSurv(x, na.rm = TRUE, weights = NULL, ...)
NeventsSurv(x, na.rm = TRUE, weights = NULL, times = 1:5, ...)
NriskSurv(x, na.rm = TRUE, weights = NULL, times = 1:5, ...)
Nrisk(x, na.rm = TRUE, weights = NULL, times = 1:5, ...)
medTime(x, na.rm = TRUE, weights = NULL, ...)
q1q3(x, na.rm = TRUE, weights = NULL, ...)
medianq1q3(x, na.rm = TRUE, weights = NULL, ...)
iqr(x, na.rm = TRUE, weights = NULL, ...)
Nmiss(x, weights = NULL, ...)
Nmiss2(x, weights = NULL, ...)
N(x, na.rm = TRUE, weights = NULL, ...)
Npct(
  х,
  levels = NULL,
  by,
  by.levels = sort(unique(by)),
  na.rm = TRUE,
 weights = NULL,
  . . . .
  totallab = "Total"
)
count(x, levels = NULL, na.rm = TRUE, weights = NULL, ...)
countpct(x, levels = NULL, na.rm = TRUE, weights = NULL, ...)
countN(x, levels = NULL, na.rm = TRUE, weights = NULL, ...)
```

tableby.stats

```
countrowpct(
  х,
  levels = NULL,
 by,
 by.levels = sort(unique(by)),
 na.rm = TRUE,
 weights = NULL,
  ...,
  totallab = "Total"
)
countcellpct(
  х,
 levels = NULL,
 by,
  by.levels = sort(unique(by)),
 na.rm = TRUE,
 weights = NULL,
  ...,
  totallab = "Total"
)
binomCI(x, levels = NULL, na.rm = TRUE, weights = NULL, conf.level = 0.95, ...)
rowbinomCI(
  х,
 levels = NULL,
 by,
 by.levels = sort(unique(by)),
 na.rm = TRUE,
 weights = NULL,
 conf.level = 0.95,
  ...,
  totallab = "Total"
)
```

х	Usually a vector.	
na.rm	Should NAs be removed?	
	Other arguments.	
weights	A vector of weights.	
conf.level	Numeric, denoting what confidence level to use for confidence intervals.	
times	A vector of times to use for survival summaries.	
levels	A vector of levels that character xs should have.	
by	a vector of the by-values.	

by.levels	a vector of the levels of by.
totallab	What to call the total "column"

Details

Not all these functions are exported, in order to avoid conflicting NAMESPACES. Note also that the functions prefixed with "arsenal_" can be referred to by their short names (e.g., "min" for "arsenal_min").

Value

Usually a vector of the appropriate numbers.

See Also

includeNA, tableby.control

tableby.stats.internal

Internal tableby functions

Description

A collection of functions that may help users create custom functions that are formatted correctly.

Usage

```
as.tbstat(
  х,
 oldClass = NULL,
  sep = NULL,
  parens = NULL,
  sep2 = NULL,
 pct = NULL,
  . . .
)
as.countpct(
  х,
  ...,
 which.count = setdiff(seq_along(x), which.pct),
 which.pct = 0L
)
as.tbstat_multirow(x)
```

write2

Arguments

х	Usually a vector.	
oldClass	class(es) to add to the resulting object.	
sep	The separator between x[1] and the rest of the vector.	
parens	A length-2 vector denoting parentheses to use around $x[2]$ and $x[3]$.	
sep2	The separator between $x[2]$ and $x[3]$.	
pct	For statistics of length 2, the symbol to use after the second one. (It's called "pct" because usually the first statistic is never a percent, but the second often is.)	
	arguments to pass to as.tbstat.	
which.count	Which statistics are counts? The default is everything except the things that are percents.	
which.pct	Which statistics are percents? The default is 0, indicating that none are.	

Details

The vignette has an example on how to use these.

as.tbstat defines a tableby statistic with its appropriate formatting.

as.countpct adds another class to as.tbstat to use different "digits" arguments (i.e., digits.count or digits.pct). See tableby.control.

as.tbstat_multirow marks an object (usually a list) for multiple-row printing.

write2	write2		
--------	--------	--	--

Description

Functions to output tables to a single document. (Also the S3 backbone behind the write2* functions.)

Usage

```
write2(object, file, ..., output_format)
## S3 method for class 'arsenal_table'
write2(object, file, ..., output_format = NULL)
## S3 method for class 'summary.arsenal_table'
write2(object, file, ..., output_format = NULL)
## S3 method for class 'comparedf'
write2(object, file, ..., output_format = NULL)
```

```
## S3 method for class 'summary.comparedf'
write2(object, file, ..., output_format = NULL)
## S3 method for class 'verbatim'
write2(object, file, ..., output_format = NULL)
## S3 method for class 'yaml'
write2(object, file, ..., output_format = NULL)
## S3 method for class 'code.chunk'
write2(object, file, ..., output_format = NULL)
## S3 method for class 'knitr_kable'
write2(object, file, ..., output_format = NULL)
## S3 method for class 'xtable'
write2(object, file, ..., output_format = NULL)
## S3 method for class 'character'
write2(object, file, ..., output_format = NULL)
## S3 method for class 'list'
write2(
 object,
  file,
  . . . ,
  append. = FALSE,
  render. = TRUE,
 keep.rmd = !render.,
  output_format = NULL
)
## Default S3 method:
write2(
  object,
  file,
  FUN = NULL,
  . . . ,
  append. = FALSE,
  render. = TRUE,
  keep.rmd = !render.,
  output_format = NULL
)
```

object	An object.
file	A single character string denoting the filename for the output document.

	Additional arguments to be passed to FUN, rmarkdown::render, etc. One popular option is to use quiet = TRUE to suppress the command line output.	
output_format	One of the following:	
	 An output format object, e.g. rmarkdown::html_document(). A character string denoting such a format function, e.g. "html_document". In this case, the "" are NOT passed. The format function itself, e.g. rmarkdown::html_document. In this case, the "" arguments are passed. One of "html", "pdf", and "word", shortcuts implemented here. In this case, the "" arguments are passed. NULL, in which the output is HTML by default. 	
	See rmarkdown::render for details.	
append.	Logical, denoting whether (if a temporary .Rmd file of the same name already exists) to append on. Used mostly for write2.list.	
render.	Logical, denoting whether to render the temporary .Rmd file. Used mostly for write2.list.	
keep.rmd	Logical, denoting whether to keep the intermediate .Rmd file. Used mostly for write2.list.	
FUN	The summary-like or print-like function to use to generate the markdown con- tent. Can be passed as a function or a character string. It's expected that FUN(object,) looks "good" when put directly in a .Rmd file.	

Details

write2 is an S3 method. The default prints the object (using print) inside a section surrounded by three back ticks. See verbatim for details.

There are methods implemented for tableby, modelsum, and freqlist, all of which use the summary function. There are also methods compatible with kable, xtable, and pander_return. Another option is to coerce an object using verbatim() to print out the results monospaced (as if they were in the terminal). To output multiple tables into a document, simply make a list of them and call the same function as before. Finally, to output code chunks to be evaluated, use code.chunk.

For more information, see vignette("write2").

Value

object is returned invisibly, and file is written.

Author(s)

Ethan Heinzen, adapted from code from Krista Goergen

See Also

```
write2word, write2pdf, write2html, render, word_document, html_document, pdf_document,
rtf_document, md_document, odt_document
```

Examples

```
## Not run:
data(mockstudy)
# tableby example
tab1 <- tableby(arm ~ sex + age, data=mockstudy)</pre>
write2(tab1, tempfile(fileext = ".rtf"),
 toc = TRUE, # passed to rmarkdown::rtf_document, though in this case it's not practical
  quiet = TRUE, # passed to rmarkdown::render
  title = "My cool new title", # passed to summary.tableby
  output_format = rmarkdown::rtf_document)
write2html(list(
  "# Header 1", # a header
  code.chunk(a <- 1, b <- 2, a + b), # a code chunk
  verbatim("hi there") # verbatim output
),
  tempfile(fileext = ".html"),
  quite = TRUE)
## End(Not run)
```

write2.internal *Helper functions for* write2

Description

Helper functions for write2.

Usage

```
verbatim(...)
```

code.chunk(..., chunk.opts = "r")

Arguments

	For verbatim, objects to print out monospaced (as if in the terminal). For
	code.chunk, either expressions or single character strings to paste into the code
	chunk.
chunk.opts	A single character string giving the code chunk options. Make sure to specify the engine!

Details

The "verbatim" class is to tell write2 to print the object inside a section surrounded by three back ticks. The results will look like it would in the terminal (monospaced).

code.chunk() is to write explicit code chunks in the .Rmd file; it captures the call and writes it to the file, to execute upon knitting.

write2specific write2word, write2html, write2pdf

Description

Functions to output tables to a single Word, HTML, or PDF document.

Usage

```
write2word(object, file, ...)
write2pdf(object, file, ...)
```

```
write2html(object, file, ...)
```

Arguments

object	An object.
file	A single character string denoting the filename for the output document.
	Additional arguments to be passed to FUN, rmarkdown::render, etc. One popular option is to use quiet = TRUE to suppress the command line output.

Details

To generate the appropriate file type, the write2* functions use one of rmarkdown::word_document, rmarkdown::html_document, and rmarkdown::pdf_document to get the job done. "..." arguments are passed to these functions, too.

Value

object is returned invisibly, and file is written.

Author(s)

Ethan Heinzen, adapted from code from Krista Goergen

write2

Examples

```
## Not run:
data(mockstudy)
# tableby example
tab1 <- tableby(arm ~ sex + age, data=mockstudy)
write2html(tab1, "~/trash.html")
```

yaml

```
# freqlist example
tab.ex <- table(mockstudy[, c("arm", "sex", "mdquality.s")], useNA = "ifany")
noby <- freqlist(tab.ex, na.options = "include")
write2pdf(noby, "~/trash2.pdf")
# A more complicated example
write2word(tab1, "~/trash.doc",
    keep.md = TRUE,
    reference_docx = mystyles.docx, # passed to rmarkdown::word_document
    quiet = TRUE, # passed to rmarkdown::render
    title = "My cool new title") # passed to summary.tableby</pre>
```

End(Not run)

yaml

Include a YAML header in write2

Description

Include a YAML header in write2

Usage

```
yaml(...)
## S3 method for class 'yaml'
print(x, ...)
## S3 method for class 'yaml'
c(..., recursive = FALSE)
```

is.yaml(x)

Arguments

	For yaml(), arguments to be bundled into a list and passed to as.yaml. For
	<pre>print.yaml(), extra arguments. For c.yaml(), "yaml" objects to be concate- nated.</pre>
х	An object of class "yaml".
recursive	Not in use at this time.

Value

A text string of class "yaml".

Author(s)

Ethan Heinzen, adapted from an idea by Brendan Broderick

%nin%

See Also

as.yaml,write2

Examples

```
x <- yaml(title = "My cool title", author = "Ethan P Heinzen")
x
y <- yaml("header-includes" = list("\\usepackage[labelformat=empty]{caption}"))
y
c(x, y)</pre>
```

%nin% Not in

Description

The not-in operator for R.

Usage

x %nin% table

Arguments

х	vector or NULL: the values to be matched.
table	vector or NULL: the values to be matched against.

Value

The negation of %in%.

Author(s)

Raymond Moore
