

# Package ‘atRisk’

January 14, 2025

**Title** At-Risk

**Version** 0.2.0

**Description** The at-Risk (aR) approach is based on a two-step parametric estimation procedure that allows to forecast the full conditional distribution of an economic variable at a given horizon, as a function of a set of factors. These density forecasts are then be used to produce coherent forecasts for any downside risk measure, e.g., value-at-risk, expected shortfall, downside entropy. Initially introduced by Adrian et al. (2019) <[doi:10.1257/aer.20161923](https://doi.org/10.1257/aer.20161923)> to reveal the vulnerability of economic growth to financial conditions, the aR approach is currently extensively used by international financial institutions to provide Value-at-Risk (VaR) type forecasts for GDP growth (Growth-at-Risk) or inflation (Inflation-at-Risk). This package provides methods for estimating these models. Datasets for the US and the Eurozone are available to allow testing of the Adrian et al. (2019) model. This package constitutes a useful toolbox (data and functions) for private practitioners, scholars as well as policymakers.

**Depends** R (>= 3.5.0)

**License** GPL-3

**Encoding** UTF-8

**LazyData** true

**RoxygenNote** 7.2.3

**Date** 2025-01-07

**Imports** stats, quantreg, sn, dfoptim, ggplot2, ggridges

**Author** Quentin Lajaunie [aut, cre],  
Guillaume Flament [aut, ctb],  
Christophe Hurlin [aut],  
Souzan Kazemi [rev]

**Maintainer** Quentin Lajaunie <quentin\_lajaunie@hotmail.fr>

**NeedsCompilation** no

**Repository** CRAN

**Date/Publication** 2025-01-14 18:50:01 UTC

<i>data_euro</i>	<i>Historical data for the eurozone (GDP and Financial Conditions) from 2008:Q4 to 2022:Q3</i>
------------------	--

---

### Description

*data\_euro* contains: - Quarterly annualized GDP, from 2008:Q4 to 2022:Q3 - Financial Condition Index of the euro Area, from 2008:Q4 to 2022:Q3 - Composite Indicator of Systemic Stress, from 2008:Q4 to 2022:Q3 Sources : <https://sdw.ecb.europa.eu/browseExplanation.do?node=9689686> [https://webstat.banque-france.fr/ws\\_wsen/browseSelection.do?node=DATASETS\\_FCI](https://webstat.banque-france.fr/ws_wsen/browseSelection.do?node=DATASETS_FCI) <https://fred.stlouisfed.org/series/CLVMEURSCAB1GQEAD>

### Usage

```
data("data_euro")
```

### Format

A data frame with 56 observations on the following 4 variables.

**DATE** Vector of dates.

**GDP** Vector of annualized PIB.

**FCI** Historical values of the Financial Condition Index (FCI).

**CISS** Historical values of the Composite Indicator of Systemic Stress (CISS).

---

data_param_histo_US	<i>Historical parameters (skew-t) for the US from 1973:Q1 to 2020:Q1</i>
---------------------	--

---

### Description

Data corresponding to historical parameters estimated over the period 1973:Q1 to 2020:Q1, based on the data\_US file in the matrisk package, with the skew-t distribution, and calculated with the f\_param\_histo function. data\_param\_histo\_US has been calculated using c(0.05,0.25,0.75,0.95) for the qt\_trgt parameter, PIB\_us\_forward\_1 as the dependent variable, NFCI\_us\_lag\_1 as the explanatory variable, "skew-t" for the type\_function parameter and c(0, 1, -0.5, 1.3) for the starting\_values.

### Usage

```
data("data_param_histo_US")
```

### Format

A matrix with 188 rows and 4 columns for the four parameters of the skew-t distribution).

---

data_US	<i>Historical data for the US (GDP and Financial Conditions) from 1973:Q1 to 2020:Q1</i>
---------	--

---

### Description

data\_euro contains: - Quarterly annualized GDP, from 1973:Q1 to 2020:Q1 - National Financial Condition Index of the US, from 1973:Q1 to 2020:Q1 Sources : <https://www.chicagofed.org/research/data/nfcı/current-data> <https://fred.stlouisfed.org/series/A191RL1Q225SBEA>

### Usage

```
data("data_US")
```

### Format

A data frame with 189 observations on the following 3 variables.

DATE Vector of dates.

GDP Vector of annualized PIB.

NFCI Historical values of the National Financial Condition Index (NFCI).

**f\_compile\_quantile**      *Estimation of quantiles*

## Description

Predicted values based on each quantile regression (Koenker and Bassett, 1978), at time=t\_trgt, for each quantile in qt\_trgt.

## Usage

```
f_compile_quantile(qt_trgt, v_dep, v_expl, newdata = NULL)
```

## Arguments

qt_trgt	Numeric vector, dim k, of k quantiles for different qt-estimations
v_dep	Numeric vector of the dependent variable
v_expl	Numeric vector or matrix of the (k) explanatory covariate(s)
newdata	Numeric optional vector of the (k) out of sample explanatory covariate(s)

## Value

A list with the following elements:

quantile_target	Numeric vector, dim k, of k quantiles for different qt-estimations.
results_qt	Numeric matrix with all the predicted values based on each quantile regression, where each column corresponds to a quantile target. This matrix includes out-of-sample values of the dependent variable if ‘newdata’ is specified.

## References

Koenker, Roger, and Gilbert Bassett Jr. "Regression quantiles." *Econometrica: journal of the Econometric Society* (1978): 33-50.

## Examples

```
# Import data
data("data_euro")

# Data process
PIB_euro_forward_4 = data_euro["GDP"][c(5:length(data_euro["GDP"][,1])),]
FCI_euro_lag_4 = data_euro["FCI"][c(1:(length(data_euro["GDP"][,1]) - 4)),]
CISS_euro_lag_4 = data_euro["CISS"][c(1:(length(data_euro["GDP"][,1]) - 4)),]

quantile_target <- as.vector(c(0.10,0.25,0.75,0.90))
results_quantile_reg <- f_compile_quantile(qt_trgt=quantile_target,
v_dep=PIB_euro_forward_4,
v_expl=as.matrix(cbind(FCI_euro_lag_4, CISS_euro_lag_4)))
```

---

f_distrib	<i>Distribution</i>
-----------	---------------------

---

## Description

This function is used to estimate the parameters of the distribution for each period (mean and standard deviation for Gaussian Distribution, xi, omega and alpha for Skew-Normal Distribution, and xi, omega, alpha, and nu for t-student Distribution) based on the quantile regression results (Koenker and Bassett, 1978). See Adrian et al. (2019) and Adrian et al. (2022) for more details on the estimation steps.

## Usage

```
f_distrib(type_function, compile_qt, starting_values, tolerance = 1e-06)
```

## Arguments

type_function	String argument : "gaussian" for Normal Distribution, "skew-gaussian" for Skew-Normal Distribution or "skew-t" for t-student Distribution
compile_qt	List containing the results of f_compile_quantile function
starting_values	Numeric vector with initial values for optimization
tolerance	Numeric optional for the convergence tolerance. Iteration is terminated when the absolute difference in function value between successive iteration is below tol (default value = 1.e-06).

## Value

Dataframe with the parameters of the distribution for each period. This dataframe includes out of sample values of the paramateres if newdata has been specified in f\_compile\_quantile.

## Examples

```
# Import data
data("data_euro")

# Data process
PIB_euro_forward_4 = data_euro["GDP"][[c(5:length(data_euro["GDP"][,1])),]]
FCI_euro_lag_4 = data_euro["FCI"][[c(1:(length(data_euro["GDP"][,1]) - 4)),]]
CISS_euro_lag_4 = data_euro["CISS"][[c(1:(length(data_euro["GDP"][,1]) - 4)),]]

# for a gaussian
quantile_target <- as.vector(c(0.25,0.75))
results_quantile_reg <- f_compile_quantile(qt_trgt=quantile_target,
v_dep=PIB_euro_forward_4,
v_expl=cbind(FCI_euro_lag_4, CISS_euro_lag_4))

results_g <- f_distrib(type_function="gaussian",
compile_qt=results_quantile_reg,
starting_values=c(0, 1))

# for a skew-t
quantile_target <- as.vector(c(0.10,0.25,0.75,0.90))
results_quantile_reg <- f_compile_quantile(qt_trgt=quantile_target,
v_dep=PIB_euro_forward_4,
v_expl=cbind(FCI_euro_lag_4, CISS_euro_lag_4))

results <- f_distrib(type_function="skew-t",
compile_qt=results_quantile_reg,
starting_values=c(0, 0.5, 0, 2), tolerance=1e-05)
```

f\_ES

*Expected Shortfall*

## Description

The function allows to calculate Expected-shortfall for a given distribution. It takes as parameters alpha (risk level), a distribution and the parameters associated with this distribution. For example, for a normal distribution, the user must enter the mean and the standard deviation. Currently, the function can calculate the Expected-shortfall for the normal distribution, the skew-normal distribution and for the skew-t distribution (Azzalini and Capitanio, 2003)

## Usage

```
f_ES(alpha, type_function, params, accuracy = 0.005)
```

### Arguments

alpha	Numeric argument for Expected-Shortfall, between 0 and 1
type_function	String argument : "gaussian" for normal distribution, "skew-gaussian" for Skew-Normal Distribution or "skew-t" for t-student distribution
params	Numeric vector containing parameters of the distribution
accuracy	Scalar value which regulates the accuracy of the ES (default value 1e-05)

### Value

Numeric value for the expected-shortfall given the distribution and the alpha risk.

### References

- Azzalini, Adelchi, and Antonella Capitanio. "Distributions generated by perturbation of symmetry with emphasis on a multivariate skew t-distribution." Journal of the Royal Statistical Society: Series B (Statistical Methodology) 65.2 (2003): 367-389.
- Azzalini, Adelchi, and Maintainer Adelchi Azzalini. "Package 'sn'." The skew-normal and skew-t distributions (2015): 1-3.

### Examples

```
f_ES(0.95, "gaussian", params=c(0,1))
f_ES(0.95, "gaussian", params=c(0,1), accuracy=1e-05)
f_ES(0.95, "gaussian", params=c(0,1), accuracy=1e-04)
```

## f\_histRM

*Historical parameters*

### Description

This function allows to calculate historical historical parameters and the VaR and ES for each historical period.

### Usage

```
f_histRM(param_hist, type_function, alpha)
```

### Arguments

param_hist	Dataframe with the parameters of the distribution for each period.
type_function	String argument : "gaussian" for Normal Distribution, "skew-gaussian" for Skew-Normal Distribution or "skew-t" for t-student distribution
alpha	Numeric argument for Expected-Shortfall, between 0 and 1

**Value**

A list with historical estimated coefficients, VaR(alpha) and ES(alpha)

**Examples**

```
data("data_euro")

# Data process
PIB_euro_forward_4 = data_euro["GDP"][c(5:length(data_euro["GDP"][,1])),]
FCI_euro_lag_4 = data_euro["FCI"][c(1:(length(data_euro["GDP"][,1]) - 4)),]
CISS_euro_lag_4 = data_euro["CISS"][c(1:(length(data_euro["GDP"][,1]) - 4)),]

results_quantile_reg <- f_compile_quantile(qt_trgt=as.vector(c(0.10,0.25,0.75,0.90)),
v_dep=PIB_euro_forward_4,
v_expl=cbind(FCI_euro_lag_4, CISS_euro_lag_4))

histo_param <- f_distrib(type_function="skew-t",
compile_qt=results_quantile_reg,
starting_values=c(0, 1, -0.5, 1.3))

# for a skew-t
results_s <- f_histo_RM(param_histo = histo_param,
type_function="skew-t",
alpha=0.95)
```

**f\_nadaraya\_watson\_quantile**

*Estimation of quantiles using the Nadaraya-Watson estimator with a product kernel*

**Description**

This function performs quantile regression using the Nadaraya-Watson estimator with a product kernel. It computes the weights using a Gaussian kernel for each dimension of the explanatory variables and then estimates the quantile using a weighted average of the observed responses.

**Usage**

```
f_nadaraya_watson_quantile(v_dep, v_expl, qt_trgt, bandwidth)
```

**Arguments**

v_dep	Numeric vector of the dependent variable
v_expl	Numeric vector or matrix of the (k) explanatory covariate(s)
qt_trgt	Numeric vector, dim k, of k quantiles for different qt-estimations
bandwidth	Numeric value specifying the bandwidth for the Gaussian kernel

**Value**

Numeric matrix with all the predicted values based on each quantile regression, where each column corresponds to a quantile target.

**Examples**

```
# Data process
set.seed(123)
Y <- as.vector(rnorm(100))
X <- matrix(rnorm(200), ncol = 2)
quantile_target <- c(0.1, 0.5, 0.9)
bandwidth_value <- 0.5

results_qt <- f_nadaraya_watson_quantile(v_dep=Y,
v_expl=X,
qt_trgt=quantile_target,
bandwidth=bandwidth_value)
```

f\_plot\_distrib\_2D

*Plot of historical distributions in 2D***Description**

This function allows to create a plot in 2D of historical distributions.

**Usage**

```
f_plot_distrib_2D(
  m_param_histo,
  type_function,
  v_date = NULL,
  v_var_dep,
  x_lab,
  y_lab,
  x_min = NULL,
  x_max = NULL,
  color_theme = c("#bd8e42", "gray30", "#876b3a", "khaki1")
)
```

**Arguments**

- |                            |  |
|----------------------------|--|
| <code>m_param_histo</code> | Numeric matrix containing the parameters of the <code>f_param_hist</code> function                                   |
| <code>type_function</code> | String argument specifying the distribution type (gaussian, skew-gaussian or skew-t)                                 |
| <code>v_date</code>        | Vector optional of dates containing the full sample's dates (default value : daily dates starting from "1970-01-01") |

v_var_dep	Numeric vector containing the realization of the dependent variable
x_lab	String optional argument for the x axis title (default value = x)
y_lab	String optional argument for the y axis title (default value = y)
x_min	Numeric optional argument (default value = VaR 97.5)
x_max	Numeric optional argument (default value = VaR 2.5)
color_theme	A character vector specifying the color theme to use (default value c("#bd8e42", "gray30", "#876b3a", "khaki"))

**Value**

A plot of historical distributions with the median, four quantiles (5th, 25th, 75th, 95th) and the realized dependent variable.

**Examples**

```
# Import data
data(data_US)
data(data_param_hist_US)

results_plot_2D <- f_plot_distrib_2D(m_param_hist=data_param_hist_US,
type_function="skew-t",
v_date=data_US[,1],
v_var_dep=data_US[,2],
x_lab="US GDP variation",
y_lab="Year")
```

*f\_plot\_distrib\_3D*      *Plot of historical distributions in 3D*

**Description**

This function allows to create a plot in 3D of historical distributions.

**Usage**

```
f_plot_distrib_3D(
  m_param_hist,
  type_function,
  v_date = NULL,
  n_samples = 10000,
  x_min = NULL,
  x_max = NULL,
  x_lab,
  y_lab,
  color_theme = c("#bd8e42", "#bebfbf")
)
```

## Arguments

<code>m_param_hist</code>	Numeric matrix containing the parameters of the <code>f_param_hist</code> function
<code>type_function</code>	String argument specifying the distribution type ("gaussian", "skew-gaussian" or "skew-t")
<code>v_date</code>	Vector optional of dates containing the full sample's dates (default value : daily dates starting from "1970-01-01")
<code>n_samples</code>	Number optional of samples for the plot (default value = 1000)
<code>x_min</code>	Numeric optional argument (default value = VaR 97.5)
<code>x_max</code>	Numeric optional argument (default value = VaR 2.5)
<code>x_lab</code>	String optional argument for the x axis title (default value = <code>x</code> )
<code>y_lab</code>	String optional argument for the y axis title (default value = <code>y</code> )
<code>color_theme</code>	A character vector specifying the color theme to use (default value c("#bd8e42", "#bebfbf"))

## Value

A plot in 3D of historical distributions

## Examples

```
# Import data
data(data_US)

data(data_param_hist_US)

results_plot_3D <- f_plot_distrib_3D(m_param_hist=data_param_hist_US,
type_function="skew-t",
v_date=data_US[,1],
x_lab="US GDP variation",
y_lab="Year")
```

## Description

The function allows to calculate Value-at-Risk for a given distribution. It takes as parameters alpha (risk level), a distribution and the parameters associated with this distribution. For example, for a normal distribution, the user must enter the mean and the standard deviation. Currently, the function can calculate the Value-at-Risk for the normal distribution and for the skew-t distribution (Azzalini and Capitaino, 2003)

## Usage

```
f_VaR(alpha, type_function, params)
```

**Arguments**

alpha	Numeric argument for Expected-Shortfall, between 0 and 1
type_function	String argument : "gaussian" for Normal Distribution, "skew-gaussian" for Skew-Normal Distribution or "skew-t" for T-student Distribution
params	Numeric vector containing parameters of the distribution

**Value**

Numeric value for the Value-at-Risk given the distribution and the alpha risk

**References**
