

# Package ‘fastliu’

February 5, 2024

**Title** Fast Functions for Liu Regression with Regularization Parameter  
and Statistics

**Version** 1.0

**Date** 2024-02-02

**Maintainer** Murat Genç <[muratgenc@tarsus.edu.tr](mailto:muratgenc@tarsus.edu.tr)>

**Description** Efficient computation of the Liu regression coefficient paths, Liu-related statistics and information criteria for a grid of the regularization parameter.

The computations are based on the 'C++' library 'Armadillo' through the 'R' package 'Rcpp'.

**License** GPL (>= 3)

**Encoding** UTF-8

**NeedsCompilation** yes

**RoxxygenNote** 7.2.3

**LinkingTo** Rcpp, RcppArmadillo

**Imports** graphics, Rcpp, stats

**Depends** R (>= 3.6)

**Author** Murat Genç [aut, cre] (<<https://orcid.org/0000-0002-6335-3044>>),  
Ömer Özbilen [aut]

**LazyData** true

**Repository** CRAN

<b>coef.liureg</b>	<i>Extract coefficient estimates from a liureg object</i>
--------------------	---

---

## Description

Prints coefficient estimates from a fitted liureg object.

## Usage

```
## S3 method for class 'liureg'
coef(object, ...)
```

## Arguments

object	A liureg object.
...	Not used in this implementation.

## Value

The returned object is a data.frame containing the coefficients path.

## Author(s)

Murat Genç

## See Also

[liureg\(\)](#), [predict\(\)](#), [summary\(\)](#), [pressliu\(\)](#), [residuals\(\)](#)

## Examples

```
data("Hitters")
Hitters <- na.omit(Hitters)
X <- model.matrix(Salary ~ ., Hitters)[, -1]
y <- Hitters$Salary
lam <- seq(0, 1, 0.01)
liu.mod <- liureg(X, y, lam)
coef(liu.mod)
```

---

**covliu***Covariance matrix based on a fitted liureg object.*

---

## Description

For a scalar or vector tuning parameter lambda, the covliureg computes the covariance matrix for the estimates of a Liu regression model.

## Usage

```
covliu(obj)
```

## Arguments

**obj** A liureg object.

## Value

The returned object is a list of the matrix of estimated covariances.

## Author(s)

Murat Genç and Ömer Özbilen

## See Also

## Examples

```
data("Hitters")
Hitters <- na.omit(Hitters)
X <- model.matrix(Salary ~ ., Hitters)[, -1]
y <- Hitters$Salary
lam <- seq(0, 1, 0.01)
liu.mod <- liureg(X, y, lam)
# List of covariance matrices for 101 lambda values
cov.mat <- covliu(liu.mod)
print(cov.mat$lam1)
```

**diagHliu***Diagonal Elements of the Hat Matrix***Description**

For each value of the regularization parameter lambda, `diagHliu` returns the diagonal elements of the hat matrix. Unlike the `hatliu` function, only the diagonal elements of the hat matrix are calculated, thus the computation of diagonal elements is faster than `hatliu`.

**Usage**

```
diagHliu(obj)
```

**Arguments**

obj	A liureg object
-----	-----------------

**Value**

The returned object is a matrix whose columns are the diagonal elements of the hat matrix for each value of the lambda regularization parameter.

**Author(s)**

Murat Genç

**See Also**

**Examples**

```
data("Hitters")
Hitters <- na.omit(Hitters)
X <- model.matrix(Salary ~ ., Hitters)[, -1]
y <- Hitters$Salary
lam <- seq(0, 1, 0.01)
liu.mod <- liureg(X, y, lam)
diagHliu(liu.mod)
```

---

hatliu	<i>Hat matrix of Liu Regression</i>
--------	-------------------------------------

---

## Description

For each value of the regularization parameter lambda, `hatliu` returns the hat matrix of Liu regression. The hat matrix for Liu regression is computed using the formula  $\mathbf{H} = \mathbf{X} (\mathbf{X}^T \mathbf{X} + \mathbf{I}_p)^{-1} (\mathbf{X}^T \mathbf{X} + \lambda \mathbf{I}_p) (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T$

## Usage

```
hatliu(obj)
```

## Arguments

`obj` A `liureg` object.

## Value

The returned object is a list of matrices whose elements are the hat matrices for the values of the lambda regularization parameter.

## Author(s)

Murat Genç

## See Also

## Examples

```
data("Hitters")
Hitters <- na.omit(Hitters)
X <- model.matrix(Salary ~ ., Hitters)[, -1]
y <- Hitters$Salary
lam <- seq(0, 1, 0.01)
liu.mod <- liureg(X, y, lam)
# Hat matrix list
hatlist <- hatliu(liu.mod)
# Hat matrix for third regularization parameter
hatlist[[3]]
```

---

Hitters	<i>Hitters</i>
---------	----------------

---

**Description**

Major League Baseball Data from the 1986 and 1987 seasons.

**Format**

A data frame with 322 observations of major league players on the following 20 variables with explanations.

AtBat	Number of times at bat in 1986
Hits	Number of hits in 1986
HmRun	Number of home runs in 1986
Runs	Number of runs in 1986
RBI	Number of runs batted in 1986
Walks	Number of walks in 1986
Years	Number of years in the major leagues
CAtBat	Number of times at bat during his career
CHits	Number of hits during his career
CHmRun	Number of home runs during his career
CRuns	Number of runs during his career
CRBI	Number of runs batted in during his career
CWalks	Number of walks during his career
League	A factor with levels A and N indicating player's league at the end of 1986
Division	A factor with levels E and W indicating player's division at the end of 1986
PutOuts	Number of put outs in 1986
Assists	Number of assists in 1986
Errors	Number of errors in 1986

Salary	1987 annual salary on opening day in thousands of dollars
NewLeague	A factor with levels A and N indicating player's league at the beginning of 1987

## Source

The dataset was retrieved from the StatLib library maintained at Carnegie Mellon University. This is part of the data used in the 1988 ASA Graphics Section Poster Session. The dataset is available in the R package ISLR2 (James et al., 2022). For more details, see the book, *An Introduction to Statistical Learning with applications in R* by James et al. (2013).

## Description

For each value of  $\lambda$ , infoliu calculates the values of the AIC and BIC model selection criteria. Model selection criteria are based on the degrees of the freedom,  $df = \text{trace}(\mathbf{H}_\lambda)$  of the Liu regression model where  $\mathbf{H}$  is the hat matrix of Liu regression model.

## Usage

```
infoliu(obj)
```

## Arguments

obj	A liureg object
-----	-----------------

## Value

infoliu returns the matrix of information criteria for each value of the regularization parameter lambda.

infoliu(liu.mod)
```

lamest

*Computation of Liu Tuning Parameter*

## Description

lamest computes the Liu tuning parameters provided in the literature. The tuning parameter estimates are based on

- Liu (1993) [doi:10.1080/03610929308831027](https://doi.org/10.1080/03610929308831027),
- Ozkale and Kaciranlar (2007) [doi:10.1080/03610920601126522](https://doi.org/10.1080/03610920601126522),
- Liu (2011) [doi:10.1016/j.jspi.2010.05.030](https://doi.org/10.1016/j.jspi.2010.05.030).

## Usage

```
lamest(obj, ...)
```

## Arguments

obj	An object of class liureg.
...	Not used in this implemetation.

## Details

The lamest function computes the following tuning parameter estimates available in the literature.

lam.mm (Liu, 1993)	$1 - \hat{\sigma}^2 \left( \frac{\sum_{j=1}^p \frac{1}{\lambda_j(1+\lambda_j)}}{\sum_{j=1}^p \frac{\hat{\alpha}_j^2}{(1+\lambda_j)^2}} \right)$
lam.CL (Liu, 1993)	$1 - \hat{\sigma}^2 \left( \frac{\sum_{j=1}^p \frac{1}{(1+\lambda_j)}}{\sum_{j=1}^p \frac{\lambda_j \hat{\alpha}_j^2}{(1+\lambda_j)^2}} \right)$
lam.opt (Liu, 1993)	$\frac{\sum_{j=1}^p \left( \frac{\alpha_j^2 - \sigma^2}{(1+\lambda_j)^2} \right)}{\sum_{j=1}^p \left( \frac{\sigma^2 + \lambda_j \alpha_j^2}{\lambda_j(1+\lambda_j)^2} \right)}$
lam.OK (Ozkale and Kaciranlar, 2007; Liu, 2011)	$\frac{\sum_{i=1}^n \frac{\tilde{e}_i}{1-g_{ii}} \left( \frac{\tilde{e}_i}{1-h_{1-ii}} - \frac{\hat{e}_i}{1-h_{ii}} \right)}{\sum_{i=1}^n \left( \frac{\tilde{e}_i}{1-g_{ii}} - \frac{\hat{e}_i}{1-h_{ii}} \right)^2}$ with $\hat{e}_i = y_i - \mathbf{x}_i^T (\mathbf{X}^T \mathbf{X} - \mathbf{x}_i \mathbf{x}_i^T)^{-1} (\mathbf{X}^T \mathbf{y})$
lam.GCV	This is the $\lambda$ value corresponding to the minimum of the generalized cross

## Value

The return object is the Liu tuning parameter estimates based on the literature.

## Author(s)

Murat Genç and Ömer Özbilen

```

**liureg**

*Fit a Liu Regression Coefficients Path*

## Description

`liureg` fits coefficients paths for Liu regression models over a grid of values for the regularization (biasing) parameter `lambda`. The returned object is of class `liureg`.

## Usage

```
liureg(X, y, lambda = 1, scale = c("ulength", "unormal", "none"), ...)
```

## Arguments

<code>X</code>	The design matrix of features. <code>fastliu</code> standardizes the data and includes an intercept term by default.
<code>y</code>	The response vector.
<code>lambda</code>	User-specified values of <code>lambda</code> . The default value is 1, which corresponds to the least squares estimator. A <code>lambda</code> sequence can be entered to generate multiple models.
<code>scale</code>	Scaling type of the design matrix. "ulength" corresponds to unit-length scaling. In this scaling the scaled design matrix is in the form of a correlation matrix. "unormal" scales the features to have unit variance (using $1/n$ rather than $1/(n - 1)$ formula). "none" does not make scaling and computations are done on centered features.
<code>...</code>	Not used in this implementation.

## Details

The sequence of Liu regression models indexed by the tuning parameter.  $\lambda$  are obtained by

$$\hat{\boldsymbol{\beta}}^{liu}(\lambda) = (\mathbf{X}^T \mathbf{X} + \mathbf{I}_p)^{-1} (\mathbf{X}^T \mathbf{y} + \lambda \hat{\boldsymbol{\beta}}^{ls}),$$

where  $\hat{\boldsymbol{\beta}}^{ls}$  is the ordinary least squares estimator. To obtain the models, the singular value decomposition (SVD) of the matrix  $\mathbf{X}$  is used. This SVD is done once and is used to generate all models.

Explanatory variables in the design matrix are always centered before fitting a model in the `fastliu` package. For scaling, two options are possible: unit-length and unit-normal scaling. In unit-length

scaling, the matrix of explanatory variables has correlation form. In unit-normal scaling, the explanatory variables have zero mean and unit variance. Both Coefficient estimates based on the scaled data and in original scale are presented. The intercept of the model is not penalized and computed by  $\bar{y} - \bar{X}\hat{\beta}_1$ , where  $\bar{X}$  is the row vector of the explanatory variables and  $\hat{\beta}_1$  is computed based on centered design matrix.

The returned liureg object is used for statistical testing of Liu coefficients, plotting method and computing the Liu regression related statistics.

### Value

Fitted Liu regression object with the class of liureg

### Author(s)

data("Hitters")
Hitters <- na.omit(Hitters)
X <- model.matrix(Salary ~ ., Hitters)[, -1]
y <- Hitters$Salary
lam <- seq(0, 1, 0.05)
liu.mod <- liureg(X, y, lam)
```

**plot.liureg**

*Plot method for liureg objects*

### Description

Plot method for liureg objects

### Usage

```
## S3 method for class 'liureg'
plot(x, type = c("coefpath", "biasvar", "info"), ...)
```

### Arguments

- |                   |   |
|-------------------|---|
| <code>x</code>    | A liureg object.  |
| <code>type</code> | What to plot on the vertical axis. <code>coefpath</code> plots the coefficient path of the Liu regression; <code>biasvar</code> generates a bias-variance plot, <code>info</code> plots the information criteria corresponding the regularization parameter values. |
| <code>...</code>  | Other graphical parameters to <code>plot</code> .   |

**Value**

No return value.

**Author(s)**

Murat Genç

**Examples**

```
Hitters <- na.omit(Hitters)
X <- model.matrix(Salary ~ ., Hitters)[, -1]
y <- Hitters$Salary
liu.mod <- liureg(X, y, seq(0, 1, 0.01))

# Liu coefficient paths
plot(liu.mod)

# Bias-variance trade-off
plot(liu.mod, type="biasvar")
```

***predict.liureg***

*Predict method for liureg objects*

**Description**

Predict method for liureg objects

**Usage**

```
## S3 method for class 'liureg'
predict(object, newdata, ...)
```

**Arguments**

- |         |   |
|---------|---|
| object  | A liureg object.  |
| newdata | A data frame of new values for X at which predictions are to be made. Can be a <code>data.frame</code> or a <code>matrix</code> . |
| ...     | Not used in this implementation.  |

**Value**

Depending on whether the lambda is a scalar or a vector, the `predict.liureg` function returns a vector or matrix of predictions, respectively.

**Author(s)**

Murat Genç

**See Also**[liureg\(\)](#), [predict\(\)](#), [summary\(\)](#), [pressliu\(\)](#), [residuals\(\)](#)**Examples**

```
data("Hitters")
Hitters <- na.omit(Hitters)
X <- model.matrix(Salary ~ ., Hitters)[, -1]
y <- Hitters$Salary
lam <- seq(0, 1, 0.01)
liu.mod <- liureg(X, y, lam)
# Predictions based on original X matrix.
predict(liu.mod)
# Predictions based on newdata. newdata can be a matrix or a data.frame.
predict(liu.mod, newdata=X[1:5, ])
```

pressliu

*Predicted Residual Sum of Squares (PRESS)***Description**

`pressliu` computes the predicted residual sum of squares (PRESS) based on a Liu regression model.

**Usage**

```
pressliu(obj, digits = 5L, ...)
```

**Arguments**

- |                     |   |
|---------------------|---|
| <code>obj</code>    | A <code>liureg</code> object.   |
| <code>digits</code> | Decimal places in the columns of data frame of PRESS values. Can be an integer or vector of integers. |
| <code>...</code>    | Not used in this implementation.  |

**Details**

The PRESS statistic is based on the predicted leave-one-out residual sum of squares. The statistic is computed as  $\sum_{i=1}^n \left( \frac{\hat{e}_{\lambda i}}{1-h_{1-ii}} - \frac{e_i(h_{1-ii}-\tilde{\mathbf{H}}_{\lambda-ii})}{(1-h_{1-ii})(1-h_{ii})} \right)^2$  where  $h_{ii}$  is the  $i$ th diagonal element of the hat matrix corresponding to the least squares estimator,  $h_{1-ii}$  is the  $i$ th diagonal element of the hat matrix of the Liu estimator and  $e_{\lambda i}$  is the residual at the specific value of  $\lambda$ .

**Value**

The returned object is a vector of PRESS values computed for each lambda..

residuals(liu.mod)
```

---

<code>statliu</code>	<i>Liu Regression Statistics</i>
----------------------	----------------------------------

---

**Description**

`statliu` computes the statistics related to the Liu regression.

**Usage**

```
statliu(obj)
```

**Arguments**

<code>obj</code>	An object of class <code>liureg</code> .
------------------	--

**Details**

EDF (Liu, 1993; Hastie et al., 2009)	Effective degrees of freedom, $n - \text{trace}(2\mathbf{H}_\lambda) - \mathbf{H}_\lambda \mathbf{H}_\lambda^T$ for each $\lambda$ where $n$ is the number of observations.
<code>sigma2</code>	Computed $\hat{\sigma}^2$ from the Liu regression for each $\lambda$ .
<code>VAR</code>	Variance from the Liu regression for each $\lambda$ .
<code>BIAS2</code>	Squared-bias from the Liu regression for each $\lambda$ .
<code>MSE</code>	Mean squared error (MSE) from the Liu regression for each $\lambda$ .
<code>FVal</code>	F-statistics value from the Liu regression for each $\lambda$ .
<code>GCV</code>	Generalized cross-validation (GCV) from the Liu regression for each $\lambda$ . The GCV is computed as $(n - EDF) / \text{trace}(\mathbf{H}_\lambda)$ .
<code>R2</code>	R-squared from the Liu regression for each $\lambda$ .
<code>AdjR2</code>	Adjusted R-squared from the Liu regression for each $\lambda$ .

**Value**

The return object is the statistics related to the Liu regression.

**Author(s)**

Murat Genç

[summary.liureg](#)

*Summarizing Liu Regression Fit*

## Description

summary method for liureg objects.

## Usage

```
## S3 method for class 'liureg'
summary(object, digits, ...)
```

## Arguments

- |        |  |
|--------|--|
| object | An object of class liureg.   |
| digits | Number of decimal places in the data frame of Liu regression statistics. |
| ...    | Not used in this implementation.   |

## Details

summary.liureg produces an object with S3 class summary.liureg. The function returns a list of summary statistics of the Liu regression fit for the grid of regularization parameter  $\lambda$  values. Each element of the output list includes:

- |              |  |
|--------------|--|
| coefficients | A $p \times 5$ matrix with columns coefficient estimates, scaled coefficient estimates, scaled standard errors, scaled |
| Statistics   | Liu related statistics $R^2$ , adjusted $R^2$ , $F$ -statistics, AIC, BIC and MSE values.                              |

**Value**

The returned object is a list whose elements are Liu regression coefficient estimates and statistics related to Liu regression.

**Author(s)**

Murat Genç

**Examples**

```
Hitters <- na.omit(Hitters)
X <- model.matrix(Salary ~ ., Hitters)[, -1]
y <- Hitters$Salary
lam <- seq(0, 1, 0.01)
liu.mod <- liureg(X, y, lam)
summary(liu.mod)
```
