

Package ‘fca’

October 13, 2022

Title Floating Catchment Area (FCA) Methods to Calculate Spatial Accessibility

Version 0.1.0

Description Perform various floating catchment area methods to calculate a spatial accessibility index (SPA1) for demand point data. The distance matrix used for weighting is normalized in a preprocessing step using common functions (gaussian, gravity, exponential or logistic).

`dist_normalize` *Distance weight methods*

Description

Distance weight methods

Usage

```
dist_normalize(D, d_max, imp_function, function_d_max = 0.01)
```

Arguments

<code>D</code>	numeric matrix, distance or time values
<code>d_max</code>	numeric, threshold for max distance
<code>imp_function</code>	character, type of distance weights method
<code>function_d_max</code>	numeric, condition for the result of the function(<code>d_max</code>) used to calculate beta (default = 0.01, is considered optimal for the Gaussian function)

Value

matrix, normalized distance or time values

Examples

```
dist_normalize(matrix(10), 10, "gaussian")
```

`spai_2sfca` *Two-Step Floating Catchment Area method*

Description

Two-Step Floating Catchment Area method

Usage

```
spai_2sfca(p, s, W, step = 2)
```

Arguments

<code>p</code>	numeric vector, number of population at origin locations
<code>s</code>	numeric vector, capacity of services at supply locations
<code>W</code>	numeric matrix, distance or time matrix
<code>step</code>	numeric, number of the steps of the method to perform

Value

data.frame, depending on selected step

Examples

```
p <- 1:4
s <- 1:6
W <- matrix(1:24, ncol = 4, nrow = 6)
spai <- spai_2sfca(p, s, W, step = 2)
```

spai_3sfca

Three-Step Floating Catchment Area method

Description

Three-Step Floating Catchment Area method

Usage

```
spai_3sfca(p, s, W, step = 3)
```

Arguments

p	numeric vector, number of population at origin locations
s	numeric vector, capacity of services at supply locations
W	numeric matrix, distance or time matrix
step	numeric, number of the steps of the method to perform

Value

data.frame, depending on selected step

Examples

```
p <- 1:4
s <- 1:6
W <- matrix(1:24, ncol = 4, nrow = 6)
spai <- spai_3sfca(p, s, W, step = 3)
```

spai_mh3sfca

Modified-Huff-Three-Step Floating Catchment Area method

Description

Modified-Huff-Three-Step Floating Catchment Area method

Usage

```
spai_mh3sfca(p, s, W, step = 3)
```

Arguments

p	numeric vector, number of population at origin locations
s	numeric vector, capacity of services at supply locations
W	numeric matrix, distance or time matrix
step	numeric, number of the steps of the method to perform

Value

data.frame, depending on selected step

Examples

```
p <- 1:4
s <- 1:6
W <- matrix(1:24, ncol = 4, nrow = 6)
spai <- spai_mh3sfca(p, s, W, step = 3)
```
