Title Formulations of the International Association for the Properties of Water and Steam

Depends R (>= 3.2.2)

Description Implementation of some of the formulations for the thermodynamic and transport properties released by the International Association for the Properties of Water and Steam (IAPWS). More specifically, the releases R1-76(2014), R5-85(1994), R6-95(2018), R7-97(2012), R8-97, R9-97, R10-06(2009), R11-24, R12-08, R15-11, R16-17(2018), R17-20 and R18-21 at <https://iapws.org>.

heavy17 *IAPWS-17 Formulation in Single Phase Regions*

Description

Compute thermodynamic and transport properties of heavy water and steam using the IAPWS formulation 2017.

Usage

```
heavy17(what, p, t, rho, state = NULL)
```

Arguments

what	a character vector listing the output properties. See Details for available properties.
p	a numeric vector giving the pressure values in MPa.
t	a numeric vector giving the temperature values in K.
rho	a numeric vector giving the density values in kg/m^3.
state	NULL or a character vector giving the physical state. One of "liquid", "gas" or "supercritical". In case of NULL, the state is determined by the function heavy17_state().

Details

The available properties for what are:

- "f": the specific free energy in kJ/kg.
- "g": the specific Gibbs enthalpy in kJ/kg.
- "u": the specific internal energy in kJ/kg.
- "h": the specific enthalpy in kJ/kg.
- "s": the specific entropy in kJ/K/kg.
- "t": the temperature in K.
- "p": the pressure in MPa.
- "v": the specific volume in m^3/kg.
- "rho": the mass density in kg/m^3.
- "cv": the specific isochoric heat capacity in kJ/K/kg.
- "cp": the specific isobaric heat capacity in kJ/K/kg.
- "alpha": the expansion coefficient in 1/K
- "beta": the pressure coefficient in MPa/K.
- "kappat": the isothermal compressibility in 1/MPa.

- "w": the speed of sound in m/s.
- "eta": the dynamic viscosity in μPa.s.
- "lambda": the thermal conductivity in mW/K/m.

A valid pair of p, rho and t is needed: either (p, t) or (rho, t).

Value

A numeric matrix of dimension c(n, length(what)) with n the maximum length of either rho, p, t or state.

Note

Computing several properties in a single call may be more efficient than separately because most of the computation time is shared.

format(tab, digits = 6)
```

`heavy17_sat` *IAPWS-17 Formulation in the Saturation Region*

Description

Compute thermodynamic and transport properties of heavy water along the saturated line according to the IAPWS formulation 2017.

Usage

```
heavy17_sat(what, p, t)
```

Arguments

`what`	a character vector listing the output properties. See Details for available properties.
`t`	a numeric vector giving the temperature values in K.
`p`	a numeric vector giving the pressure values in MPa.

Details

The available properties for `what` are:

- `"f"`: the specific free energy in kJ/kg.
- `"g"`: the specific Gibbs enthalpy in kJ/kg.
- `"u"`: the specific internal energy in kJ/kg.
- `"h"`: the specific enthalpy in kJ/kg.
- `"s"`: the specific entropy in kJ/K/kg.

- "t": the temperature in K.
- "p": the pressure in MPa.
- "v": the specific volume in m^3/kg.
- "rho": the mass density in kg/m^3.
- "cv": the specific isochoric heat capacity in kJ/K/kg.
- "cp": the specific isobaric heat capacity in kJ/K/kg.
- "alpha": the expansion coefficient in 1/K
- "beta": the pressure coefficient in MPa/K.
- "kappat": the isothermal compressibility in 1/MPa.
- "w": the speed of sound in m/s.
- "eta": the dynamic viscosity in μPa.s.
- "lambda": the thermal conductivity in mW/K/m.

Only one of t or p is needed. If both arguments are given, p is ignored.

Value

A numeric array of dimension c(n, length(what), 2L) with n the length of either p or t. The last dimension indicate the physical state ("liquid" or "gas").

Note

Computing several properties in a single call may be more efficient than separately because most of the computation time is shared.

Examples

```
# IAPWS-17 Tab. 8
M <- 20.027508  # g/mol
tab <- heavy17_sat(c("p", "rho", "h", "s"), t = c(280, 450, 625))
format(tab, scientific = TRUE, digits = 9)
```

heavy17_state *IAPWS-17 Physical States*

Description

Identify the physical state of heavy water according to the IAPWS formulation 2017.

Usage

```
heavy17_state(p, t, rho)
```

Arguments

p	a numeric vector giving the pressure values in MPa.
t	a numeric vector giving the temperature values in K.
rho	a numeric vector giving the density values in kg/m^3.

Details

A valid pair of p, rho, t is needed: either (p, t) or (rho, t).

Value

A character vector giving the physical state. One of "solid", "liquid", "gas", "supercritical", "saturated" or "undef".

Author(s)

Jonathan Debove

Examples

```
heavy17_state(p = c(.1, .1, 23), t = c(293.15, 393.15, 650))
heavy17_state(rho = c(1200, .1, 500, 500),
              t = c(293.15, 373.15, 650, 373.15))
```

IAPWS *Constants built into iapws*

Description

IAPWS and IAPWS95 contain constants relative to ordinary water substance. HEAVY17 is the same but for heavy water.

Usage

```
IAPWS
IAPWS95
HEAVY17
```

Format

IAPWS, IAPWS95 and HEAVY17 are numeric verctors with with the following named elements:

"R" molar gas constant in J/K/mol.

"M" molar mass in g/mol.

"Pc" critical pressure in MPa.

"Tc" critical temperature in K.

"RHOc" critical density in kg/m^3.

"Pt" triple-point pressure in MPa.

"Tt" triple-point temperature in K.

Examples

```
# Convert critical density of water in mol/L
IAPWS["RHOc"] / IAPWS["M"]
```

iapws95 *IAPWS-95 Formulation in Single Phase Regions*

Description

Compute thermodynamic and transport properties of water and steam using the IAPWS formulation 1995.

Usage

```
iapws95(what, p, t, rho, h, state = NULL)
```

Arguments

what	a character vector listing the output properties. See Details for available properties.
p	a numeric vector giving the pressure values in MPa.
t	a numeric vector giving the temperature values in K.
rho	a numeric vector giving the density values in kg/m^3.
h	a numeric vector giving the specific enthalpy values in kJ/kg.
state	NULL or a character vector giving the physical state. One of "liquid", "gas" or "supercritical". In case of NULL, the state is determined by the function iapws95_state().

Details

The available properties for what are:

- "f": the specific free energy in kJ/kg.
- "g": the specific Gibbs enthalpy in kJ/kg.
- "u": the specific internal energy in kJ/kg.
- "h": the specific enthalpy in kJ/kg.
- "s": the specific entropy in kJ/K/kg.
- "t": the temperature in K.
- "p": the pressure in MPa.
- "v": the specific volume in m^3/kg.
- "rho": the mass density in kg/m^3.
- "cv": the specific isochoric heat capacity in kJ/K/kg.
- "cp": the specific isobaric heat capacity in kJ/K/kg.
- "alpha": the expansion coefficient in 1/K
- "beta": the pressure coefficient in MPa/K.
- "kappat": the isothermal compressibility in 1/MPa.
- "w": the speed of sound in m/s.
- "eta": the dynamic viscosity in μPa.s.
- "lambda": the thermal conductivity in mW/K/m.

A valid pair of p, rho, t and h is needed: either (p, t), (rho, t) or (p, h).

Value

A numeric matrix of dimension c(n, length(what)) with n the maximum length of either rho, p, t, h or state.

Note

Computing several properties in a single call may be more efficient than separately because most of the computation time is shared.

`iapws95_sat` *IAPWS-95 Formulation in the Saturation Region*

Description

Compute thermodynamic and transport properties of water and steam along the saturated line according to the IAPWS formulation 1995.

Usage

```
iapws95_sat(what, p, t)
```

Arguments

`what`	a character vector listing the output properties. See Details for available properties.
`t`	a numeric vector giving the temperature values in K.
`p`	a numeric vector giving the pressure values in MPa.

Details

The available properties for `what` are:

- `"f"`: the specific free energy in kJ/kg.
- `"g"`: the specific Gibbs enthalpy in kJ/kg.
- `"u"`: the specific internal energy in kJ/kg.
- `"h"`: the specific enthalpy in kJ/kg.
- `"s"`: the specific entropy in kJ/K/kg.
- `"t"`: the temperature in K.
- `"p"`: the pressure in MPa.
- `"v"`: the specific volume in m^3/kg.
- `"rho"`: the mass density in kg/m^3.
- `"cv"`: the specific isochoric heat capacity in kJ/K/kg.
- `"cp"`: the specific isobaric heat capacity in kJ/K/kg.
- `"alpha"`: the expansion coefficient in 1/K
- `"beta"`: the pressure coefficient in MPa/K.
- `"kappat"`: the isothermal compressibility in 1/MPa.

- "w": the speed of sound in m/s.
- "eta": the dynamic viscosity in μPa.s.
- "lambda": the thermal conductivity in mW/K/m.

Only one of t or p is needed. If both arguments are given, p is ignored.

Value

A numeric array of dimension c(n, length(what), 2L) with n the length of either p or t. The last dimension indicate the physical state ("liquid" or "gas").

Note

Computing several properties in a single call may be more efficient than separately because most of the computation time is shared.

iapws95_state *IAPWS-95 Physical States*

Description

Identify the physical state of water according to the IAPWS formulation 1995.

Usage

```
iapws95_state(p, t, rho)
```

Arguments

p	a numeric vector giving the pressure values in MPa.
t	a numeric vector giving the temperature values in K.
rho	a numeric vector giving the density values in kg/m^3.

Details

A valid pair of p, rho, t is needed: either (p, t) or (rho, t).

Value

A character vector giving the physical state. One of "solid", "liquid", "gas", "supercritical", "saturated" or "undef".

Author(s)

Examples

```
iapws95_state(p = c(.1, .1, 23), t = c(293.15, 373.15, 650))
iapws95_state(rho = c(1000, .1, 500, 500),
              t = c(293.15, 373.15, 650, 373.15))
```

---

iapws_epsilon *IAPWS Formulations for Electrostatic Properties of Water*

Description

Compute the dielectric constant, refractive index and ionization constant of water.

Usage

```
iapws_epsilon(rho, t)
iapws_n(rho, t, lambda)
iapws_pk(rho, t)
```

Arguments

rho	a numeric vector giving the density values in kg/m^3.
t	a numeric vector giving the temperature values in K.
lambda	a numeric vector giving the wavelenth values in μm.

Details

For calculating the properties as function of pressure, the function iapws95() should be employed.

Value

A numeric vector.

```

---

ice06 *Equation of State 2006 for Ice Ih*

Description

Compute thermodynamic properties of ice Ih using the Equation of State 2006.

Usage

```
ice06(what, p, t)
```

Arguments

what	a character vector listing the output properties. See Details for available properties.
p	a numeric vector giving the pressure values in MPa.
t	a numeric vector giving the temperature values in K.

Details

The available properties for `what` are:

- `"f"`: the specific free energy in kJ/kg.
- `"g"`: the specific Gibbs enthalpy in kJ/kg.
- `"u"`: the specific internal energy in kJ/kg.
- `"h"`: the specific enthalpy in kJ/kg.
- `"s"`: the specific entropy in kJ/K/kg.
- `"t"`: the temperature in K.
- `"p"`: the pressure in MPa.
- `"v"`: the specific volume in m^3/kg.
- `"rho"`: the mass density in kg/m^3.
- `"cv"`: the specific isochoric heat capacity in kJ/K/kg.
- `"cp"`: the specific isobaric heat capacity in kJ/K/kg.
- `"alpha"`: the expansion coefficient in 1/K
- `"beta"`: the pressure coefficient in MPa/K.
- `"kappat"`: the isothermal compressibility in 1/MPa.
- `"w"`: the speed of sound in m/s.

Value

A numeric matrix of dimension `c(n, length(what))` with `n` the maximum length of either `p` or `t`.

Note

Computing several properties in a single call may be more efficient than separately because most of the computation time is shared.

Author(s)

Jonathan Debove

Examples

```
tab <- ice06(c("g", "h", "f", "u", "s", "cp", "rho", "alpha", "beta", "kappat"),
             p = c(611.657e-6, .101325, 100), t = c(273.16, 273.152519, 100))
format(tab, scientific = TRUE, digits = 11)
```

`if97` *IAPWS-IF97 Equations for Regions 1, 2, 3 and 5*

Description

Compute thermodynamic and transport properties of water and steam using the IAPWS industrial formulation 1997.

Usage

```
if97(what, p, t, h, state = NULL)
```

Arguments

`what`	a character vector listing the output properties. See Details for available properties.
`p`	a numeric vector giving the pressure values in MPa.
`t`	a numeric vector giving the temperature values in K.
`h`	a numeric vector giving the specific enthalpy values in kJ/kg.
`state`	`NULL` or a character vector giving the physical state. One of `"liquid"`, `"gas"` or `"supercritical"`. In case of `NULL`, the state is determined by the function `if97_state()`.

Details

The available properties for `what` are:

- `"f"`: the specific free energy in kJ/kg.
- `"g"`: the specific Gibbs enthalpy in kJ/kg.
- `"u"`: the specific internal energy in kJ/kg.
- `"h"`: the specific enthalpy in kJ/kg.
- `"s"`: the specific entropy in kJ/K/kg.
- `"t"`: the temperature in K.
- `"p"`: the pressure in MPa.
- `"v"`: the specific volume in m^3/kg.
- `"rho"`: the mass density in kg/m^3.
- `"cv"`: the specific isochoric heat capacity in kJ/K/kg.
- `"cp"`: the specific isobaric heat capacity in kJ/K/kg.
- `"alpha"`: the expansion coefficient in 1/K
- `"beta"`: the pressure coefficient in MPa/K.
- `"kappat"`: the isothermal compressibility in 1/MPa.
- `"w"`: the speed of sound in m/s.

- "eta": the dynamic viscosity in μPa.s.
- "lambda": the thermal conductivity in mW/K/m.

A valid pair of p, t and h is needed: either (p, t) or (p, h).

Value

A numeric matrix of dimension c(n, length(what)) with n the maximum length of either p, t, h or state.

Note

Computing several properties in a single call may be more efficient than separately because most of the computation time is shared.

`if97_sat` *IAPWS-IF97 Equations in Region 4*

Description

Compute the pressure and the temperature along the saturated line according to the IAPWS industrial formulation 1997.

Usage

```
if97_psat(t)
if97_tsat(p)
```

Arguments

`t`	a numeric vector giving the temperature values in K.
`p`	a numeric vector giving the pressure values in MPa.

Value

A numeric vector containing the saturation-pressure (MPa) or the saturation-temperature (K). Return `NA` for inputs outside of the range of validity.

if97_state *IAPWS-IF97 Physical States*

Description

Identify the physical state of water according to the IAPWS industrial formulation 1997.

Usage

```
if97_state(p, t)
```

Arguments

p	a numeric vector giving the pressure values in MPa.
t	a numeric vector giving the temperature values in K.

Value

A character vector giving the physical state. One of "solid", "liquid", "gas", "supercritical", "saturated" or "undef".

Author(s)

Jonathan Debove

Examples

```
if97_state(p = c(.1, .1, 23), t = c(293.15, 373.15, 650))
```
