

Package ‘imgrec’

June 21, 2024

Type Package

Title An Interface for Image Recognition

Version 0.1.4

Date 2024-06-21

URL <https://github.com/cschwem2er/imgrec>

BugReports <https://github.com/cschwem2er/imgrec/issues>

Description Provides an interface for image recognition using the 'Google Vision API' <<https://cloud.google.com/vision/>>. Converts API data for features such as object detection and optical character recognition to data frames. The package also includes functions for analyzing image annotations.

get_annotations	<i>get image annotations</i>
-----------------	------------------------------

Description

Calls the 'Google Vision' API to return annotations. The function automatically creates batches

Usage

```
get_annotations(images, features, max_res, mode)
```

Arguments

<code>images</code>	A character vector for images to be annotated. Can either be url strings or local images, as specified with <code>mode</code> .
<code>features</code>	A character vector for the features to be returned. Accepts 'all' or any combination of the following inputs: 'label', 'web', 'text', 'face', 'landmark', 'logo', 'safe_search', 'object', 'properties'
<code>max_res</code>	An integer specifying the maximum number of results to be returned for each feature.
<code>mode</code>	Accepts 'url' for image urls and 'local' for file paths to local images.

Value

An response object of class 'gvision_annotations'.

See Also

Google Vision [features](#) and [quotas](#).

Examples

```
## Not run:

gvision_init()

# one image url
sw_image <- 'https://upload.wikimedia.org/wikipedia/en/4/40/Star_Wars_Phantom_Menace_poster.jpg'
results <- get_annotations(images = sw_image, # image character vector
                           features = 'all', # request all available features
                           max_res = 10, # maximum number of results per feature
                           mode = 'url') # maximum number of results per feature

# multiple image urls
finn_image <- 'https://upload.wikimedia.org/wikipedia/en/2/2a/Finn-Force_Awakens_%282015%29.png'
padme_image <- 'https://upload.wikimedia.org/wikipedia/en/e/ee/Amidala.png'
```

```
input_imgs <- c(sw_image, finn_image, padme_image)
results <- get_annotations(images = input_imgs,
                           features = c('label', 'face'), max_res = 5, mode = 'url')

# one local image
temp_img_path <- tempfile(fileext = '.png')
download.file(finn_image, temp_img_path, mode = 'wb', quiet = TRUE)

results <- get_annotations(images = temp_img_path,
                           features = c('label', 'face'), max_res = 5, mode = 'local')

## End(Not run)
```

gvision_init*authorization for Google Vision*

Description

Initializes the authorization credentials for the 'Google Vision' API. Needs to be called before using any other functions of imgrec and requires gvision_key as environment variable.

Usage

```
gvision_init()
```

Value

nothing.

Examples

```
## Not run:
Sys.setenv(gvision_key = "Your Google Vision API key")

gvision_init()

## End(Not run)
```

`parse_annotations` *parse image annotations*

Description

Parses the annotations and converts most of the features to data frames. Also stores the corresponding image identifiers for each feature as 'img_id'

Usage

```
parse_annotations(annotations)
```

Arguments

`annotations` An annotation object created with [get_annotations](#).

Value

A list containing data frames for each feature:

- labels** label annotations
- web_labels** web label annotations
- web_similar** similar web images
- web_match_partial** partial matching web images
- web_match_full** full matching web images
- web_match_pages** matching web pages
- faces** face annotations
- objects** object annotations
- logos** logo annotations
- landmarks** landmark annotations
- full_text** full text annotation
- safe_search** safe search annotation
- colors** dominant color annotations
- crop_hints** crop hints for ratios 0.8/1.0/1.2

Examples

```
## Not run:
# initialize api credentials
gvision_init()

# annotate images
finn_image <- 'https://upload.wikimedia.org/wikipedia/en/2/2a/Finn-Force_Awakens_%282015%29.png'
sw_image <- 'https://upload.wikimedia.org/wikipedia/en/8/82/Leiadeathstar.jpg'
```

```
padme_image <- 'https://upload.wikimedia.org/wikipedia/en/e/ee/Amidala.png'

results <- get_annotations(images = c(finn_image, sw_image, padme_image),
                           features = 'all', max_res = 10, mode = 'url')
# parse annotations
img_data <- parse_annotations(results)

# available feature data frames
names(img_data)

## End(Not run)
```

save_json*save annotation data as JSON*

Description

Writes raw JSON data as returned by the Google Vision API to a UTF-8 encoded local file.

Usage

```
save_json(annotations, file)
```

Arguments

annotations	An annotation object created with get_annotations .
file	Local path where the JSON data should be stored.

Value

nothing.

Examples

```
## Not run:
gvision_init()

finn_image <- 'https://upload.wikimedia.org/wikipedia/en/2/2a/Finn-Force_Awakens_%282015%29.png'
results <- get_annotations(images = finn_image, features = 'all',
                           max_res = 10, mode = 'url')
temp_file_path <- tempfile(fileext = '.json')
save_json(results, temp_file_path)

## End(Not run)
```
