

# Package ‘survBootOutliers’

October 14, 2022

**Title** Concordance Based Bootstrap Methods for Outlier Detection in Survival Analysis

**Maintainer** Joao Pinto <joao.pinto@tecnico.ulisboa.pt>

**Version** 1.0

**URL** <https://github.com/jonydog/survBootOutliers>

**Depends** R (>= 3.4.0), survival, stats

**Imports** methods, utils

**Suggests** BiocParallel

**Author** Joao Pinto <joao.pinto@tecnico.ulisboa.pt>, Andre Verissimo <andre.verissimo@tecnico.ulisboa.pt>, Alexandra Carvalho <alexandra.carvalho@tecnico.ulisboa.pt>, Susana Vinga <susanavinga@tecnico.ulisboa.pt>

**Description** Three new methods to perform outlier detection in a survival context. In total there are six methods provided, the first three methods are traditional residual-based outlier detection methods, the second three are the concordance-based. Package developed during the work on the two following publications: Pinto J., Carvalho A. and Vinga S. (2015) <[doi:10.5220/0005225300750082](https://doi.org/10.5220/0005225300750082)>; Pinto J.D., Carvalho A.M., Vinga S. (2015) <[doi:10.1007/978-3-319-27926-8\\_22](https://doi.org/10.1007/978-3-319-27926-8_22)>.

**License** GPL-2

**RoxygenNote** 6.0.1

**biocViews** Survival

**NeedsCompilation** no

**Repository** CRAN

**Date/Publication** 2018-05-28 11:10:03 UTC

## R topics documented:

display.obs.histogram . . . . .	2
get.whas100.dataset . . . . .	3
survBootOutliers . . . . .	3

## Index

6

**display.obs.histogram** *Auxiliar function that displays the concordance histogram associated with the observation.*

## Description

Auxiliar function that displays the concordance histogram associated with the observation.

## Usage

```
display.obs.histogram(histograms, type, obs.index)
```

## Arguments

<b>histograms</b>	The histograms object returned by the survBootOutliers function when the method selected is "bht" or "dbht".
<b>type</b>	The type of histogram that is given as input, possible choices are again "bht" or "dbht".
<b>obs.index</b>	The original index of the observation of the concordance histograms to be displayed

## Value

No value is returned

## Examples

```
## Not run:
whas <- get.whas100.dataset()
outliers_bht <- survBootOutliers(
  surv.object=Surv(time = whas$times,event = whas$status ),
  covariate.data = whas[,2:5],
  sod.method = "bht",
  B = 2000, B.N = 100 ,
  parallel.param = BiocParallel::MulticoreParam()
)
display.obs.histogram(outliers_bht$histograms, "bht", 67)

## End(Not run)
```

---

`get.whas100.dataset`     *Function that retrieves the WHAS100 dataset.*

---

## Description

This function retrieves the well known Worcester Heart Attack dataset with 100 individuals (WHAS100). This dataset is taken from the book by Hosmer D, Lemeshow S, May S. Applied Survival Analysis: Regression Modeling of Time to Event Data, 2nd edition. John Wiley and Sons Inc., New York, NY, 2008.

## Usage

```
get.whas100.dataset()
```

## Value

A data.frame containing the WHAS100 dataset

## Examples

```
whas100_data <- get.whas100.dataset()
```

---

`survBootOutliers`     *Extract the most outlying observations following a criteria based on the bootstrapped concordance with parallel processing*

---

## Description

Extract the most outlying observations following a criteria based on the bootstrapped concordance with parallel processing

## Usage

```
survBootOutliers(surv.object, covariate.data, sod.method, B, B.N = NULL,
  max.outliers, parallel.param = NULL)
```

## Arguments

<code>surv.object</code>	An object of type <code>survival::Surv</code> containing lifetimes and right-censoring status
<code>covariate.data</code>	A data frame containing the data with covariate values for each individual
<code>sod.method</code>	One of c("osd", "bht", "dbht", "ld", "martingale", "deviance")
<code>B</code>	The number of bootstrap samples generated only applicable for "bht" and "dbht" methods. Typically at least 10x the size of the dataset, ideally should be increased until convergence.
<code>B.N</code>	the number of observations in each bootstrap sample
<code>max.outliers</code>	This parameter is only used for the "osd" method
<code>parallel.param</code>	(Optional) A <code>BiocParallel</code> object, examples: <code>SerialParam()</code> , <code>MulticoreParam()</code>

## Value

For all methods except for "bht" and "dbht" the value returned is a data.frame containing the most outlying observations sorted by outlying score. For the "bht" method the value returned is a list of two members: "outlier\_set": the most outlygin observations sorted by p-values; "histograms": histogram of concordance variation for each observation. For the "dbht" method the value returned is a list of two members: "outlier\_set": the most outlygin observations sorted by p-values; "histograms": histograms of concordance for each observations for the two types of bootstrap: "poison" and "antidote".

## Examples

```
## One Step Deletion "osd" method
## Not run:
whas <- get.whas100.dataset()
print( getwd() )
outliers_osd <- survBootOutliers(
  surv.object=Surv(time = whas$times,event = whas$status ),
  covariate.data = whas[,2:5],
  sod.method = "osd",
  max.outliers = 5
)
## End(Not run)

## Bootstrap Hypothesis Test "bht" with 1000 bootstrap samples,
## each with 100 individuals, running without parallelism.
## Not run:
whas <- get.whas100.dataset()
outliers_bht <- survBootOutliers(
  surv.object=Surv(time = whas$times,event = whas$status ),
  covariate.data = whas[,2:5],
  sod.method = "bht",
  B = 1000,
  B.N = 100,
  parallel.param = BiocParallel::MulticoreParam()
)
## End(Not run)

## Dual Bootstrap Hypothesis Test "dbht" with 1000 bootstrap samples,
## each with 50 individuals and running on all available cores.
## Not run: whas <- get.whas100.dataset()
outliers_dbht <- survBootOutliers(
  surv.object=Surv(time = whas$times,event = whas$status ),
  covariate.data = whas[,2:5],
  sod.method = "dbht",
  B = 1000,
  B.N = 50,
  parallel.param = BiocParallel::MulticoreParam()
)
```

```
## End(Not run)
## One Step Deletion "osd" with an amount of 10 for maximum outlier count
whas <- get.whas100.dataset()
outliers_osd <- survBootOutliers(
  surv.object=Surv(time = whas$times,event = whas$status ),
  covariate.data = whas[,2:5],
  sod.method = "osd",
  max.outliers = 10
)

## Likelihood displacement criterion for outlier ranking
whas <- get.whas100.dataset()
outliers_ld <- survBootOutliers(
  surv.object=Surv(time = whas$times,event = whas$status ),
  covariate.data = whas[,2:5],
  sod.method = "ld"
)

## Cox regression deviance residuals criterion for outlier ranking
whas <- get.whas100.dataset()
outliers_deviance <- survBootOutliers(
  surv.object=Surv(time = whas$times,event = whas$status ),
  covariate.data = whas[,2:5],
  sod.method = "deviance"
)

## Cox regression Martingale residuals criterion for outlier ranking
whas <- get.whas100.dataset()
outliers_martingale <- survBootOutliers(
  surv.object=Surv(time = whas$times,event = whas$status ),
  covariate.data = whas[,2:5],
  sod.method = "martingale"
)
```
