

# Package ‘tidypredict’

December 19, 2024

**Title** Run Predictions Inside the Database

**Version** 0.5.1

**Description** It parses a fitted 'R' model object, and returns a formula in 'Tidy Eval' code that calculates the predictions. It works with several databases back-ends because it leverages 'dplyr' and 'dbplyr' for the final 'SQL' translation of the algorithm. It currently supports lm(), glm(), randomForest(), ranger(), earth(), xgb.Booster.complete(), cubist(), and ctree() models.

**License** MIT + file LICENSE

**URL** <https://tidypredict.tidymodels.org>,  
<https://github.com/tidymodels/tidypredict>

**BugReports** <https://github.com/tidymodels/tidypredict/issues>

**Depends** R (>= 3.6)

**Imports** cli, dplyr (>= 0.7), generics, knitr, purrr, rlang (>= 1.1.1), tibble, tidyverse

**Suggests** covr, Cubist, DBI, dbplyr, earth (>= 5.1.2), methods, mlbench, modeldata, nycflights13, parsnip, partykit, randomForest, ranger, rmarkdown, RSQLite, testthat (>= 3.2.0), xgboost, yaml

**VignetteBuilder** knitr

**Config/Needs/website** tidyverse/tidytemplate

**Config/testthat.edition** 3

**Encoding** UTF-8

**RoxygenNote** 7.3.2

**NeedsCompilation** no

**Author** Emil Hvitfeldt [aut, cre],  
Edgar Ruiz [aut],  
Max Kuhn [aut]

**Maintainer** Emil Hvitfeldt <[emil.hvitfeldt@posit.co](mailto:emil.hvitfeldt@posit.co)>

**Repository** CRAN

**Date/Publication** 2024-12-19 08:50:02 UTC

---

acceptable_formula	<i>Checks that the formula can be parsed</i>
--------------------	--

---

### Description

Uses an S3 method to check that a given formula can be parsed based on its class. It currently scans for contrasts that are not supported and in-line functions. (e.g: lm(wt ~ as.factor(am))). Since this function is meant for function interaction, as opposed to human interaction, a successful check is silent.

### Usage

```
acceptable_formula(model)
```

### Arguments

model	An R model object
-------	-------------------

### Examples

```
model <- lm(mpg ~ wt, mtcars)
acceptable_formula(model)
```

---

as_parsed_model	<i>Prepares parsed model object</i>
-----------------	-------------------------------------

---

### Description

Prepares parsed model object

### Usage

```
as_parsed_model(x)
```

**Arguments**

- x A parsed model object

---

parse\_model *Converts an R model object into a table.*

---

**Description**

It parses a fitted R model's structure and extracts the components needed to create a dplyr formula for prediction. The function also creates a data frame using a specific format so that other functions in the future can also pass parsed tables to a given formula creating function.

**Usage**

```
parse_model(model)
```

**Arguments**

- model An R model object.

**Examples**

```
library(dplyr)
df <- mutate(mtcars, cyl = paste0("cyl", cyl))
model <- lm(mpg ~ wt + cyl * disp, offset = am, data = df)
parse_model(model)
```

---

tidy.pm\_regression *Tidy the parsed model results*

---

**Description**

Tidy the parsed model results

**Usage**

```
## S3 method for class 'pm_regression'
tidy(x, ...)
```

**Arguments**

- x A parsed\_model object  
... Reserved for future use

**tidypredict\_fit**      *Returns a Tidy Eval formula to calculate fitted values*

## Description

It parses a model or uses an already parsed model to return a Tidy Eval formula that can then be used inside a dplyr command.

## Usage

```
tidypredict_fit(model)
```

## Arguments

**model**      An R model or a list with a parsed model.

## Examples

```
model <- lm(mpg ~ wt + cyl * disp, offset = am, data = mtcars)
tidypredict_fit(model)
```

**tidypredict\_interval**    *Returns a Tidy Eval formula to calculate prediction interval.*

## Description

It parses a model or uses an already parsed model to return a Tidy Eval formula that can then be used inside a dplyr command.

## Usage

```
tidypredict_interval(model, interval = 0.95)
```

## Arguments

**model**      An R model or a list with a parsed model  
**interval**      The prediction interval, defaults to 0.95

## Details

The result still has to be added to and subtracted from the fit to obtain the upper and lower bound respectively.

## Examples

```
model <- lm(mpg ~ wt + cyl * disp, offset = am, data = mtcars)
tidypredict_interval(model)
```

---

tidypredict\_test      *Tests base predict function against tidypredict*

---

## Description

Compares the results of predict() and tidypredict\_to\_column() functions.

## Usage

```
tidypredict_test(  
  model,  
  df = model$model,  
  threshold = 1e-12,  
  include_intervals = FALSE,  
  max_rows = NULL,  
  xg_df = NULL  
)
```

## Arguments

model	An R model or a list with a parsed model. It currently supports lm(), glm() and randomForest() models.
df	A data frame that contains all of the needed fields to run the prediction. It defaults to the "model" data frame object inside the model object.
threshold	The number that a given result difference, between predict() and tidypredict_to_column() should not exceed. For continuous predictions, the default value is 0.000000000001 (1e-12), and for categorical predictions, the default value is 0.
include_intervals	Switch to indicate if the prediction intervals should be included in the test. It defaults to FALSE.
max_rows	The number of rows in the object passed in the df argument. Highly recommended for large data sets.
xg_df	A xgb.DMatrix object, required only for XGBoost models. It defaults to NULL recommended for large data sets.

## Examples

```
model <- lm(mpg ~ wt + cyl * disp, offset = am, data = mtcars)  
tidypredict_test(model)
```

---

**tidypredict\_to\_column** *Adds the prediction columns to a piped command set.*

---

## Description

Adds a new column with the results from tidypredict\_fit() to a piped command set. If add\_interval is set to TRUE, it will add two additional columns- one for the lower and another for the upper prediction interval bounds.

## Usage

```
tidypredict_to_column(  
  df,  
  model,  
  add_interval = FALSE,  
  interval = 0.95,  
  vars = c("fit", "upper", "lower")  
)
```

## Arguments

<code>df</code>	A data.frame or tibble
<code>model</code>	An R model or a parsed model inside a data frame
<code>add_interval</code>	Switch that indicates if the prediction interval columns should be added. Defaults to FALSE
<code>interval</code>	The prediction interval, defaults to 0.95. Ignored if add_interval is set to FALSE
<code>vars</code>	The name of the variables that this function will produce. Defaults to "fit", "upper", and "lower".
