

# Package ‘trendeval’

April 25, 2025

**Title** Evaluate Trending Models

**Version** 0.1.1

**Description** Provides a coherent interface for evaluating models fit with the trending package. This package is part of the RECON (<<https://www.repidemicsconsortium.org/>>) toolkit for outbreak analysis.

**URL** <https://github.com/reconverse/trendeval>

**BugReports** <https://github.com/reconverse/trendeval/issues>

**License** MIT + file LICENSE

**Encoding** UTF-8

**RoxygenNote** 7.3.2

**Imports** trending, yardstick, rsample, stats, tibble, utils

**Suggests** testthat (>= 3.0.0), dplyr, outbreaks

**Config/testthat.edition** 3

**NeedsCompilation** no

**Author** Dirk Schumacher [aut],  
Thibaut Jombart [aut, cre],  
Tim Taylor [ctb] (<<https://orcid.org/0000-0002-8587-7113>>)

**Maintainer** Thibaut Jombart <[thibautjombart@gmail.com](mailto:thibautjombart@gmail.com)>

**Repository** CRAN

**Date/Publication** 2025-04-25 15:20:02 UTC

**calculate\_aic** *Generic for calculating the AIC*

---

**Description**

Generic `calculate_aic()` returns the Akaike's 'An Information Criterion' for the given input.

**Usage**

```
calculate_aic(x, ...)

## Default S3 method:
calculate_aic(x, ...)

## S3 method for class 'trending_model'
calculate_aic(x, data, as_tibble = FALSE, ...)

## S3 method for class 'list'
calculate_aic(x, data, ...)

## S3 method for class 'trending_fit'
calculate_aic(x, as_tibble = FALSE, ...)

## S3 method for class 'trending_fit_tbl'
calculate_aic(x, ...)
```

**Arguments**

<code>x</code>	An R object.
<code>...</code>	Not currently used.
<code>data</code>	a <code>data.frame</code> containing data (including the response variable and all predictors) used in the specified model.
<code>as_tibble</code>	Should the result be returned as <code>tibble</code> ( <code>as_tibble = TRUE</code> ) or a list ( <code>as_tibble = FALSE</code> ).

**Details**

Specific methods are given for `trending_fit` and `trending_fit_tbl` objects. The default method applies `stats::AIC()` directly.

**Value**

For a single `trending_fit` input, if `as_tibble = FALSE` the object returned will be a list with entries:

- `metric: "AIC"`
- `result: the resulting AIC value fit (NULL if the calculation failed)`

- warnings: any warnings generated during calculation
- errors: any errors generated during calculation

If `as_tibble = TRUE`, or the input is a `trending_fit_tbl`, then the output will be a `tibble` with one row for each fitted model columns corresponding to output generated with single model input.

## Author(s)

Tim Taylor

```
#' @examples x = rnorm(100, mean = 0) y = rpois(n = 100, lambda = exp(1.5 + 0.5*x)) dat <-  
  data.frame(x = x, y = y) poisson_model <- glm_model(y ~ x, family = "poisson") negbin_model <-  
  glm_nb_model(y ~ x) fitted_model <- fit(poisson_model, dat) fitted_models <- fit(list(poisson_model,  
    negbin_model), data = dat)  
calculate_aic(poisson_model, dat) calculate_aic(fitted_model) calculate_aic(fitted_model, as_tibble  
  = TRUE) calculate_aic(fitted_models)
```

`calculate_mae`

*Generic for calculating the root mean squared error*

## Description

Generic `calculate_mae()` returns the root mean square error for the given input.

## Usage

```
calculate_mae(x, ...)

## Default S3 method:
calculate_mae(x, ...)

## S3 method for class 'trending_model'
calculate_mae(x, data, na.rm = TRUE, as_tibble = TRUE, ...)

## S3 method for class 'list'
calculate_mae(x, data, na.rm = TRUE, ...)

## S3 method for class 'trending_fit'
calculate_mae(x, new_data, na.rm = TRUE, as_tibble = TRUE, ...)

## S3 method for class 'trending_fit_tbl'
calculate_mae(x, new_data, na.rm = TRUE, ...)

## S3 method for class 'trending_predict'
calculate_mae(x, na.rm = TRUE, as_tibble = TRUE, ...)

## S3 method for class 'trending_predict_tbl'
calculate_mae(x, na.rm = TRUE, ...)
```

```
## S3 method for class 'trending_prediction'
calculate_mae(x, na.rm = TRUE, as_tibble = TRUE, ...)
```

## Arguments

x	An R object.
...	Not currently used.
data	a <code>data.frame</code> containing data (including the response variable and all predictors) used in the specified model.
na.rm	Should NA values should be removed before calculation of metric (passed to the underlying function <code>yardstick::mae_vec</code> ).
as_tibble	Should the result be returned as <code>tibble</code> ( <code>as_tibble = TRUE</code> ) or a list ( <code>as_tibble = FALSE</code> ).
new_data	a <code>data.frame</code> containing data (including the response variable and all predictors) on which to assess the model.

## Details

Specific methods are given for `trending_model` (and lists of these), `trending_fit`, `trending_fit_tbl`, `trending_predict_tbl`, `trending_predict_tbl` and `trending_prediction` objects. Each of these are simply wrappers around the `yardstick::mae_vec` with the addition of explicit error handling.

## Value

For a single `trending_fit` input, if `as_tibble = FALSE` the object returned will be a list with entries:

- metric: "mae"
- result: the resulting mae value (NULL if the calculation failed)
- warnings: any warnings generated during calculation
- errors: any errors generated during calculation

If `as_tibble = TRUE`, or for the other `trending` classes, then the output will be a `tibble` with one row for each fitted model columns corresponding to output generated with single model input.

Tim Taylor

```
#' @examples x = rnorm(100, mean = 0) y = rpois(n = 100, lambda = exp(1.5 + 0.5*x)) dat <-
  data.frame(x = x, y = y) poisson_model <- glm_model(y ~ x, family = "poisson") negbin_model <-
  glm_nb_model(y ~ x) fitted_model <- fit(poisson_model, dat) fitted_models <- fit(list(poisson_model,
  negbin_model), data = dat)
calculate_mae(poisson_model, dat) calculate_mae(fitted_model) calculate_mae(fitted_model, as_tibble =
  TRUE) calculate_mae(fitted_models)
```

---

calculate\_rmse            *Generic for calculating the root mean squared error*

---

## Description

Generic calculate\_rmse() returns the root mean square error for the given input.

## Usage

```
calculate_rmse(x, ...)

## Default S3 method:
calculate_rmse(x, ...)

## S3 method for class 'trending_model'
calculate_rmse(x, data, na.rm = TRUE, as_tibble = TRUE, ...)

## S3 method for class 'list'
calculate_rmse(x, data, na.rm = TRUE, ...)

## S3 method for class 'trending_fit'
calculate_rmse(x, new_data, na.rm = TRUE, as_tibble = TRUE, ...)

## S3 method for class 'trending_fit_tbl'
calculate_rmse(x, new_data, na.rm = TRUE, ...)

## S3 method for class 'trending_predict'
calculate_rmse(x, na.rm = TRUE, as_tibble = TRUE, ...)

## S3 method for class 'trending_predict_tbl'
calculate_rmse(x, na.rm = TRUE, ...)

## S3 method for class 'trending_prediction'
calculate_rmse(x, na.rm = TRUE, as_tibble = TRUE, ...)
```

## Arguments

x	An R object.
...	Not currently used.
data	a <code>data.frame</code> containing data (including the response variable and all predictors) used in the specified model.
na.rm	Should NA values should be removed before calculation of metric (passed to the underlying function <code>yardstick::rmse_vec</code> ).
as_tibble	Should the result be returned as <code>tibble</code> ( <code>as_tibble = TRUE</code> ) or a list ( <code>as_tibble = FALSE</code> ).
new_data	a <code>data.frame</code> containing data (including the response variable and all predictors) on which to assess the model.

## Details

Specific methods are given for `trending_model` (and lists of these), `trending_fit`, `trending_fit_tbl`, `trending_predict_tbl`, `trending_predict_tbl` and `trending_prediction` objects. Each of these are simply wrappers around the `yardstick::rmse_vec` with the addition of explicit error handling.

## Value

For a single `trending_fit` input, if `as_tibble = FALSE` the object returned will be a list with entries:

- metric: "rmse"
- result: the resulting rmse value (NULL if the calculation failed)
- warnings: any warnings generated during calculation
- errors: any errors generated during calculation

If `as_tibble = TRUE`, or for the other `trending` classes, then the output will be a `tibble` with one row for each fitted model columns corresponding to output generated with single model input.

## Author(s)

Tim Taylor

```
#' @examples x = rnorm(100, mean = 0) y = rpois(n = 100, lambda = exp(1.5 + 0.5*x)) dat <-
  data.frame(x = x, y = y) poisson_model <- glm_model(y ~ x, family = "poisson") negbin_model <-
  glm_nb_model(y ~ x) fitted_model <- fit(poisson_model, dat) fitted_models <- fit(list(poisson_model,
  negbin_model), data = dat)
  calculate_rmse(poisson_model, dat) calculate_rmse(fitted_model) calculate_rmse(fitted_model, as_tibble =
  TRUE) calculate_rmse(fitted_models)
```

`calculate_rsq`

*Generic for calculating the root mean squared error*

## Description

Generic `calculate_rsq()` returns the root mean square error for the given input.

## Usage

```
calculate_rsq(x, ...)
## Default S3 method:
calculate_rsq(x, ...)

## S3 method for class 'trending_model'
calculate_rsq(x, data, na.rm = TRUE, as_tibble = TRUE, ...)
```

```

## S3 method for class 'list'
calculate_rsq(x, data, na.rm = TRUE, ...)

## S3 method for class 'trending_fit'
calculate_rsq(x, new_data, na.rm = TRUE, as_tibble = TRUE, ...)

## S3 method for class 'trending_fit_tbl'
calculate_rsq(x, new_data, na.rm = TRUE, ...)

## S3 method for class 'trending_predict'
calculate_rsq(x, na.rm = TRUE, as_tibble = TRUE, ...)

## S3 method for class 'trending_predict_tbl'
calculate_rsq(x, na.rm = TRUE, ...)

## S3 method for class 'trending_prediction'
calculate_rsq(x, na.rm = TRUE, as_tibble = TRUE, ...)

```

## Arguments

x	An R object.
...	Not currently used.
data	a <code>data.frame</code> containing data (including the response variable and all predictors) used in the specified model.
na.rm	Should NA values should be removed before calculation of metric (passed to the underlying function <code>yardstick::rsq_vec</code> ).
as_tibble	Should the result be returned as <code>tibble</code> ( <code>as_tibble = TRUE</code> ) or a list ( <code>as_tibble = FALSE</code> ).
new_data	a <code>data.frame</code> containing data (including the response variable and all predictors) on which to assess the model.

## Details

Specific methods are given for `trending_model` (and lists of these), `trending_fit`, `trending_fit_tbl`, `trending_predict_tbl`, `trending_predict_tbl` and `trending_prediction` objects. Each of these are simply wrappers around the `yardstick::rsq_vec` with the addition of explicit error handling.

## Value

For a single `trending_fit` input, if `as_tibble = FALSE` the object returned will be a list with entries:

- metric: "rsq"
- result: the resulting rsq value (NULL if the calculation failed)
- warnings: any warnings generated during calculation
- errors: any errors generated during calculation

If `as_tibble = TRUE`, or for the other trending classes, then the output will be a `tibble` with one row for each fitted model columns corresponding to output generated with single model input.

## Author(s)

Tim Taylor

```
#' @examples x = rnorm(100, mean = 0) y = rpois(n = 100, lambda = exp(1.5 + 0.5*x)) dat <-  
data.frame(x = x, y = y) poisson_model <- glm_model(y ~ x, family = "poisson") negbin_model <-  
glm_nb_model(y ~ x) fitted_model <- fit(poisson_model, dat) fitted_models <- fit(list(poisson_model,  
negbin_model), data = dat)  
calculate_rsq(poisson_model, dat) calculate_rsq(fitted_model) calculate_rsq(fitted_models, as_tibble  
= TRUE) calculate_rsq(fitted_models)
```

`evaluate_aic`

*Generic for calculating the AIC*

## Description

`evaluate_aic()` is a generic for evaluating the Akaike's 'An Information Criterion' for a given input

## Usage

```
evaluate_aic(x, ...)  
  
## Default S3 method:  
evaluate_aic(x, ...)  
  
## S3 method for class 'trending_model'  
evaluate_aic(x, data, as_tibble = FALSE, ...)  
  
## S3 method for class 'list'  
evaluate_aic(x, data, ...)
```

## Arguments

<code>x</code>	An R object.
<code>...</code>	Not currently used.
<code>data</code>	a <code>data.frame</code> containing data (including the response variable and all predictors) used in the specified model.
<code>as_tibble</code>	Should the result be returned as <code>tibble</code> ( <code>as_tibble = TRUE</code> ) or a list ( <code>as_tibble = FALSE</code> ).

## Details

Specific methods are given for `trending_fit` and lists of these models.

**Value**

If `as_tibble = TRUE`, or the input is a list of models then the output will be a `tibble` with one row for each fitted model columns corresponding to output generated with single model input.

**Author(s)**

Tim Taylor

```
#' @examples x = rnorm(100, mean = 0) y = rpois(n = 100, lambda = exp(1.5 + 0.5*x)) dat <-
  data.frame(x = x, y = y) poisson_model <- glm_model(y ~ x, family = "poisson") negbin_model
  <- glm_nb_model(y ~ x)
  evaluate_aic(poisson_model, dat) evaluate_aic(list(poisson_model, negbin_model), data = dat)
```

`evaluate_resampling`    *Resampling approach for model evaluation*

**Description**

`evaluate_resampling()` uses repeated K-fold cross-validation and the Root Mean Square Error (RMSE) of testing sets to measure the predictive power of a single model. Methods are provided for `trending::trending_model` (and lists of these) objects.

**Usage**

```
evaluate_resampling(x, ...)

## Default S3 method:
evaluate_resampling(x, ...)

## S3 method for class 'trending_model'
evaluate_resampling(
  x,
  data,
  metric = c("rmse", "rsq", "mae"),
  metric_arguments = list(na.rm = TRUE),
  v = 5,
  repeats = 1,
  ...
)

## S3 method for class 'list'
evaluate_resampling(
  x,
  data,
  metric = c("rmse", "rsq", "mae"),
  metric_arguments = list(na.rm = TRUE),
  v = 5,
```

```

repeats = 1,
...
)

```

## Arguments

x	An R object.
...	Not currently used.
data	a <code>data.frame</code> containing data (including the response variable and all predictors) used in the specified model.
metric	One of "rmse" (see <a href="#">calculate_rmse</a> ), "mae" (see <a href="#">calculate_mae</a> ) and "rsq" (see <a href="#">calculate_rsq</a> ).
metric_arguments	A named list of arguments passed to the underlying functions that calculate the metrics.
v	the number of equally sized data partitions to be used for K-fold cross-validation; v cross-validations will be performed, each using v - 1 partition as training set, and the remaining partition as testing set. Defaults to the number of row in data, so that the method uses leave-one-out cross validation, akin to Jackknife except that the testing set (and not the training set) is used to compute the fit statistics.
repeats	the number of times the random K-fold cross validation should be repeated for; defaults to 1; larger values are likely to yield more reliable / stable results, at the expense of computational time

## Details

These functions wrap around existing functions from several packages. `evaluate_resampling.trending_model()` and `evaluate_resampling.list()` both use `rsample::vfold_cv()` for sampling and, for the calculating the different metrics, the `yardstick` package.
