Package 'vegtable'

March 14, 2023

```
Version 0.1.8
Encoding UTF-8
Title Handling Vegetation Data Sets
Depends R(>=3.5.0), taxlist (>= 0.2.4)
Imports foreign, methods, qdapRegex, sp, stats, stringi, utils,
      vegdata
Suggests biblio, knitr, rmarkdown, sf, testthat, vegan
Description Import and handling data from vegetation-plot databases, especially
      data stored in 'Turboveg 2' (<a href="https://www.synbiosys.alterra.nl/turboveg/">https://www.synbiosys.alterra.nl/turboveg/</a>).
      Also import/export routines for exchange of data with 'Juice'
      (<https://www.sci.muni.cz/botany/juice/>) are implemented.
LazyData true
License GPL (>= 2)

add_releves 3

add_releves Merge relevés from data frames into vegtable objects

Description

Addition of plot observations into existing data sets may implicate merging data frames with vegtable objects.

Since this function will only update slots **samples** and **header**, consistency with slots **layers**, **relations** and **species** have to be checked and accordingly updated in advance.

Usage

```
add_releves(vegtable, releves, ...)
## S4 method for signature 'vegtable,data.frame'
add_releves(
  vegtable,
  releves,
  header,
  abundance,
  split_string,
  usage_ids = FALSE,
  layers = FALSE,
  layers_var,
  format = "crosstable",
 preserve_ids = FALSE,
)
add_releves(vegtable, ...) <- value</pre>
## S4 replacement method for signature 'vegtable,data.frame'
add_releves(vegtable, ...) <- value</pre>
```

Arguments

vegtable	An object of class vegtable.
releves	A data frame including plot observations to be added into vegtable.
	Further arguments passed to function cross2db() (i.e. na_strings).
header	A data frame (optional) including header information for plots.
abundance	A character value (or vector of length 2) indicating the names of abundance variable in vegtable.
split_string	Character value used to split mixed abundance codes.
usage_ids	Logical value indicating whether species are as taxon usage ids (integers) or names in releves.

4 as

layers Logical value indicating whether layers are included in releves or not.

layers_var Name of the layer variable in vegtable.

format Character value indicating input format of releves (either "crosstable" or

"databaselist").

preserve_ids A logical value, whether IDs in input data set should used as ReleveID or not.

Those IDs have to be integers and if one of those already exists in vegtable, an

error will be retrieved.

value A data frame containing new plot observations. I is passed to parameter 'releves'

by the replace method.

Author(s)

Miguel Alvarez <kamapu78@gmail.com>

cross2db()

as

Coerce objects to lists

Description

Coerce vegtable objects to a list with every slot as a component of the list. This way allows to explore content and solve problems when validity checks fail.

Coercion is applied for different classes by vegtable.

Usage

```
## S4 method for signature 'vegtable'
as.list(x, ...)
## S4 method for signature 'coverconvert'
as.list(x, ...)
```

Arguments

x An object to be coerced.

. . . further arguments passed from or to other methods.

Value

An object of class list.

Author(s)

Miguel Alvarez <kamapu78@gmail.com>

aspect_conv-data 5

Examples

```
## vegtable as list
veg <- as(Kenya_veg, "list")
names(veg)
## coverconvert as list
as(Kenya_veg@coverconvert, "list")</pre>
```

aspect_conv-data

Conversion of aspect classes to azimuth

Description

Conversion table required to transform values of aspect to azimuth in degrees.

Usage

```
aspect_conv
```

Format

A numeric vector of values in degrees for the symbols used as names.

Author(s)

Miguel Alvarez <kamapu78@gmail.com>

Examples

```
aspect_conv[c("N", "S", "ENE", "SSW")]
```

braun_blanquet-data

Conversion of Braun-Blanquet codes to cover percentage

Description

Cover values conversion as coverconvert object.

Object of class coverconvert contains conversion tables usually from a categorical variable (a cover scale) to a numerical one (equivalent percentage cover value). Cover values are stored as range for each level in the scale (minimum and maximum cover value).

Usage

braun_blanquet

6 clean

Format

An object of class coverconvert.

See Also

```
coverconvert cover_trans()
```

Examples

```
names(braun_blanquet)
summary(braun_blanquet)
summary(braun_blanquet$b_bbds)
```

clean

Clean orphaned records in vegtable object

Description

Delete entries in slots header and species orphaned by manipulation of slots.

Orphaned records generated by modifications in some slots may cause a loss on the validity of vegtable objects. This function should be applied to optimise the allocated size of a vegtable object, as well. Since running cleaning only once does not assure the deletion of all orphaned entries, it is recommended to run it at least twice. This repetition of cleaning is controlled by the argument times.

Usage

```
clean_once(object)
## S4 method for signature 'vegtable'
clean(object, times = 2, ...)
```

Arguments

object A vegtable object.

times Numeric value indicating how many times should be the cleaning be repeated.

Further arguments passed from or to other methods.

Value

A clean vegtable object.

Author(s)

Miguel Alvarez <kamapu78@gmail.com>

count_taxa 7

Examples

```
## Create an invalid object
veg <- Kenya_veg
veg@header <- veg@header[1:10, ]
## Resolve invalidity
veg <- clean(veg)</pre>
```

count_taxa

Count taxa included in vegtable objects

Description

Counting number of taxa within taxlist objects or character vectors containing taxon names.

This function provides a quick calculation of taxa in vegtable objects, considering only records in slot samples. Such records can be also merged from lower ranks.

For the formula method, units without any requested taxa will not appear in the output data frame. If no taxa at all is occurring at the requested level in any unit, an error message will be retrieved.

Usage

```
## S4 method for signature 'vegtable,missing'
count_taxa(object, level, include_lower = FALSE, ...)

## S4 method for signature 'formula,vegtable'
count_taxa(
   object,
   data,
   include_lower = FALSE,
   suffix = "_count",
   in_header = TRUE,
   ...
)

count_taxa(data, ...) <- value

## S4 replacement method for signature 'vegtable,formula'
count_taxa(data, ...) <- value</pre>
```

Arguments

object An object of class vegtable or a formula.

level Character value indicating the taxonomic rank of counted taxa.

include_lower Logical value, whether lower taxonomic ranks should be included at the re-

quested level.

8 coverconvert

... further arguments passed among methods.

data An object of class vegtable.

suffix Character value used as suffix on the calculated variable.

in_header Logical value, whether the result should be included in the slot header of the

input vegtable object or not. A warning message is provided if the calculation is

not done for every plot observation.

value A formula passed to parameter 'object' by the replace method.

Value

An data frame with the number of taxa from requested level at requested units for the formula method, or just an integer value.

Author(s)

Miguel Alvarez <kamapu78@gmail.com>

Examples

```
## Different alternatives
count_taxa(Kenya_veg)
head(count_taxa(~ReleveID, Kenya_veg, in_header = FALSE))
head(count_taxa(species ~ ReleveID, Kenya_veg, in_header = FALSE))
head(count_taxa(species ~ ReleveID, Kenya_veg, TRUE, in_header = FALSE))
head(count_taxa(family ~ ReleveID, Kenya_veg, TRUE))
```

coverconvert

Cover conversion tables

Description

Cover conversion tables for vegtable objects.

This class implements conversions from different cover scales in percentage cover. For transformations to percentage cover, the function cover_trans() should be than used.

Slots

value List containing the levels of each scale.

conversion List with the respective start and end cut levels for the scale levels.

Author(s)

Miguel Alvarez <kamapu78@gmail.com>

tv2coverconvert() braun_blanquet.

cover_trans 9

	.		
cover	τı	rai	าร

Convert cover scales to percent cover

Description

Convert values of a categorical cover scale to percentage values.

This function requires as input a coverconvert object which contains the conversion tables.

Usage

```
## S4 method for signature 'character,coverconvert'
cover_trans(x, conversion, from = NULL, rule = "top", zeroto = 0.1, ...)
## S4 method for signature 'factor,coverconvert'
cover_trans(x, conversion, ...)
## S4 method for signature 'numeric,coverconvert'
cover_trans(x, conversion, ...)
## S4 method for signature 'vegtable,missing'
cover_trans(x, to, replace = FALSE, rule = "top", zeroto = 0.1, ...)
```

Arguments

X	Either a factor or c	haracter vector,	or a vegtable	object.
---	----------------------	------------------	---------------	---------

conversion An object of class vegtable.

from Scale name of values in x as character value.

rule A character value indicating the rule applied for cover transformation. Three

rules are implemented for transformation, either top (values transformed to the top of the range), middle (transformation at the midpoint), and bottom (conversion at the lowest value of the range). In the later case, if the bottom is zero

cover, a fictive bottom value can be set by 'zeroto'

zeroto Value set for transformation of classes with bottom at 0% cover.

... Further arguments passed from or to other methods.

to Name of the column in slot samples for writing converted values.

replace Logical value indicating whether existing cover values should be replaced by

the new computed values or not.

Value

Either a vector or a vegtable object.

Author(s)

Miguel Alvarez <kamapu78@gmail.com>

10 crosstable

Examples

```
## Check the available scales
summary(Kenya_veg@coverconvert)

## Conversion by default 'top' rule
Kenya_veg <- cover_trans(Kenya_veg, to = "percent")
summary(as.factor(Kenya_veg@samples$percent))

## Conversion by 'middle' rule
Kenya_veg <- cover_trans(Kenya_veg, to = "percent", rule = "middle", replace = TRUE)
summary(as.factor(Kenya_veg@samples$percent))

## Conversion by 'bottom' rule
Kenya_veg <- cover_trans(Kenya_veg, to = "percent", rule = "bottom", replace = TRUE)
summary(as.factor(Kenya_veg@samples$percent))</pre>
```

crosstable

Generating cross tables from database lists

Description

cross table is the most common format required by statistical packages used to analyse vegetation data (e.g. vegan).

You may use for convenience a formula as 'abundance ~ plot + species + . . . '. Additional variables used for rows (...) can be for instance the layers. For objects of class vegtable, the formula can also include variables from the species list (for example AcceptedName, AuthorName) or even taxon traits.

If required, tables already formatted as cross tables can be converted into column-oriented tables by using the function cross2db().

```
crosstable(formula, data, ...)

## S4 method for signature 'formula,data.frame'
crosstable(
  formula,
  data,
  FUN,
  na_to_zero = FALSE,
  use_nas = TRUE,
  as_matrix = FALSE,
  ...
)

## S4 method for signature 'formula,vegtable'
crosstable(formula, data, FUN, na_to_zero = FALSE, use_nas = TRUE, ...)
```

crosstable 11

```
cross2db(object, layers = FALSE, na_strings)
```

Arguments

formula	A formula indicating the variables used in the cross table. This formula can be represented as 'abundance ~ cols + rows', where 'abundance' is the numeric variable quantified for a row in a column, for instance the abundance of a species in a plot. Further variables can be set as additional rows indices in a cross table.
data	Either a data frame or an object of class vegtable.
	Further arguments passed to the function stats::aggregate().
FUN	Function used to aggregate values in the case of a multiple occurrence of a species in a plot, for instance.
na_to_zero	A logical value indicating whether zeros should be inserted into empty cells or not.
use_nas	Logical value indicating whether NAs should be considered as levels for categorical variables or not.
as_matrix	A logical value, whether output should be done as matrix or data frame.
object	A data frame including a cross table.
layers	Logical value, whether the cross table includes a layer column or not.
na_strings	Character vector indicating no records in the cross table.

Value

An object of class data.frame.

Author(s)

Miguel Alvarez <kamapu78@gmail.com>

```
veg <- subset(Kenya_veg, REFERENCE == 2331, slot = "header")

## transform cover to percentage
veg <- cover_trans(veg, to = "cover_perc", rule = "middle")

## cross table of the first 5 plots
Cross <- crosstable(cover_perc ~ ReleveID + AcceptedName + AuthorName,
    veg[1:5, ], mean,
    na_to_zero = TRUE
)
head(Cross)</pre>
```

12 df2coverconvert

df2coverconvert

Create coverconvert objects

Description

The class coverconvert contains tables for transforming cover values to percentage using the function cover_trans(). These objects can be created from conversion tables imported as data frames.

Usage

```
df2coverconvert(x, ...)
## S3 method for class 'list'
df2coverconvert(x, ...)
## S3 method for class 'data.frame'
df2coverconvert(x, name, ...)
```

Arguments

Х

Either a data frame or a list of data frames containing the conversion table. Three columns are mandatory in such data frames, namely **value** (factor with the symbols for each class in the cover scale, sorted from the lowest to the highest value), **bottom** (numeric value with the bottom values of each class), and **top** (numeric value with the top values of each class). The values **bottom** and **top** are usually as cover percentage but they may refer to any other numeric abundance.

. . .

Further arguments passed among methods.

name

A character value used as name of the cover scale in the data frame method. In the list method, this name will be extracted from the names of the elements in the list.

Author(s)

Miguel Alvarez <kamapu78@gmail.com>

```
## Convert object into list
cov <- as(Kenya_veg@coverconvert, "list")
## Convert back to coverconvert
cov <- df2coverconvert(cov)</pre>
```

df2vegtable 13

Description

Conversion of a data frame containing a cross table of abundance or cover of species in single plots.

This function coerces a data frame containing a vegetation cross table into a vegtable object. The input data frame x may include information on the layers or not.

Usage

```
df2vegtable(x, species, layer, ...)
## S4 method for signature 'data.frame,numeric,numeric'
df2vegtable(x, species, layer, ...)
## S4 method for signature 'data.frame,numeric,missing'
df2vegtable(x, species, layer, ...)
```

Arguments

Χ	A data frame formatted for a taxlist object.
species	Numeric or integer indicating the position of the column with species names.
layer	Numeric or integer indicating the position of the column with layers.
	Further arguments passed from or to other methods.

Value

A vegtable object.

Author(s)

Miguel Alvarez <kamapu78@gmail.com>

```
## Creating data set 'dune_veg'
library(vegan)

## Load data from vegan
data(dune)
data(dune.env)

## Conversion to vegtable
dune_veg <- data.frame(
   species = colnames(dune), t(dune),
   stringsAsFactors = FALSE, check.names = FALSE</pre>
```

14 dune_veg-data

```
dune_veg <- df2vegtable(dune_veg, species = 1)
summary(dune_veg)
## Adding environmental variables
dune.env$ReleveID <- as.integer(rownames(dune.env))
header(dune_veg) <- dune.env
summary(dune_veg)</pre>
```

dune_veg-data

Dutch dune meadows as vegtable

Description

Data set from the package vegan::vegan, converted to a vegtable object.

Usage

dune_veg

Format

An object of class vegtable.

Source

Original data were imported from vegan::dune.

Extract 15

Ext	ra	\sim $+$
$L \Lambda L$	ıa	·ι

Select or replace elements in objects

Description

Methods for quick access to slot header of vegtable objects or for access to single cover scales in coverconvert objects. Also replacement methods are implemented.

Usage

```
## S4 method for signature 'vegtable'
x$name

## S4 replacement method for signature 'vegtable,ANY'
x$name <- value

## S4 method for signature 'coverconvert'
x$name

## S4 method for signature 'coverconvert'
x[i]

## S4 replacement method for signature 'coverconvert,coverconvert'
x$name <- value

## S4 method for signature 'vegtable'
x[i, j, ..., drop = FALSE]

## S4 replacement method for signature 'vegtable'
x[i, j] <- value</pre>
```

Arguments

X	Object of class vegtable.
name	A name to access.
value	Either a vectors or a list, used as replacement.
i, j	Indices for access.
	Further arguments passed to or from other methods.
drop	A logical value passed to Extract.

Author(s)

Miguel Alvarez <kamapu78@gmail.com>

Examples

```
## Range of latitude values in database
range(Kenya_veg$LATITUDE)

## Summary of countries
summary(Kenya_veg$COUNTRY)
summary(droplevels(Kenya_veg$COUNTRY))

## First 5 samples
summary(Kenya_veg[1:5, ])
```

header

Retrieve or replace slot header in vegtable objects

Description

Retrieve or replace the content of slot header in vegtable objects.

Usage

```
header(x, ...)
## S4 method for signature 'vegtable'
header(x, ...)
header(x) <- value
## S4 replacement method for signature 'vegtable,data.frame'
header(x) <- value</pre>
```

Arguments

x Object of class vegtable.

... Further arguments passed to or from other methods.

value Data frame to be set as slot header.

Author(s)

Miguel Alvarez <kamapu78@gmail.com>

```
head(header(Kenya_veg))
```

Kenya_veg-data 17

Kenya_veg-data

Vegetation-plots from Kenya

Description

A subset of http://www.givd.info/ID/AF-00-006SWEA-Dataveg including five references providing plots collected in Kenya.

Usage

Kenya_veg

Format

An object of class vegtable.

Examples

summary(Kenya_veg)

18 layers2samples

layers2samples	Add information from slot 'layers' into slot 'samples'
Tay Cr 323amp1C3	That injornation from stor tayers thio stor samples

Description

Slot layers may include additional information that should be moved to samples in order to use it by subset(), aggregate() or crosstable() methods.

If names of variables are not provided, all variables from the respective layer table will be inserted in slot samples.

Usage

```
layers2samples(object, layer, variable, ...)
## S4 method for signature 'vegtable, character, character'
layers2samples(object, layer, variable, ...)
## S4 method for signature 'vegtable, character, missing'
layers2samples(object, layer, variable, ...)
```

Arguments

object An object of class vegtable.

layer Character value indicating a target layer.

variable Character vector with the names of variables to be inserted in slot samples.

... Further arguments to be passed among methods.

Value

An object of class vegtable with variables added to samples.

Author(s)

Miguel Alvarez <kamapu78@gmail.com>.

make_cocktail 19

make_cocktail

Produce a Cocktail classification

Description

Classification of vegtable objects according to Cocktail algorithms.

Cocktail algorithms are logical functions selecting plots according to either occurrence of species groups and cover values of single species. A group will be declared as occurring in a plot when at least a half of its members is present in the plot.

This function inserts single columns with logical values indicating whether a plot is classified in the vegetation unit or not. An additional column (name provided in argument syntax) compile all vegetation units, indicating with a + symbol those plots classified in more than one vegetation unit. When only a part of the formulas will be used, it should be specified by the argument which.

These functions are implemented for constructing or complementing shaker objects. Note that construction of those objects will always require a companion object, which is either an object of class taxlist or vegtable.

```
set_group(shaker, companion, group, ...)
## S4 method for signature 'shaker,taxlist,character'
set_group(
  shaker,
  companion,
  group,
  group_id,
 authority = FALSE,
 enc_cont = "latin1",
  enc_gr = "utf8",
)
## S4 method for signature 'shaker, vegtable, character'
set_group(shaker, companion, group, ...)
set_pseudo(shaker, companion, pseudo, ...)
## S4 method for signature 'shaker,taxlist,character'
set_pseudo(
  shaker,
  companion,
  pseudo,
 pseudo_id,
  authority = FALSE,
  enc_cont = "latin1",
```

20 make_cocktail

```
enc_gr = "utf8",
)
## S4 method for signature 'shaker, vegtable, character'
set_pseudo(shaker, companion, pseudo, ...)
set_formula(shaker, companion, formula, ...)
## S4 method for signature 'shaker,taxlist,character'
set_formula(
  shaker,
  companion,
  formula,
  formula_id,
  authority = FALSE,
 enc_cont = "latin1",
  enc_gr = "utf8",
)
## S4 method for signature 'shaker, vegtable, character'
set_formula(shaker, companion, formula, ...)
make_cocktail(shaker, vegtable, ...)
## S4 method for signature 'shaker, vegtable'
make_cocktail(
  shaker,
 vegtable,
 which,
  cover,
  syntax = "Syntax",
 FUN = sum,
  in_header = TRUE,
)
```

Arguments

shaker An object of class shaker containing the respective cocktail definitions.

companion Either a taxlist or a vegtable object.

Further arguments passes from or to other methods.

authority Logical value indicating whether author names should be included in the taxon

name or not.

enc_cont, enc_gr

Encodings used for special characters.

make_cocktail 21

pseudo, group Character vector with names of taxa included in a pseudo-species or a species group.

pseudo_id, group_id, formula_id

Character value as name of the pseudo-species, species group or defined vege-

tation unit.

formula Character vector including a formula as definition of a vegetation unit.

vegtable An object of class vegtable containing the vegetation observations to be classi-

fied.

which Integer or character indicating the definition to be applied for classification.

cover Name of the cover variable in vegtable.

syntax Character value indicating the name of the retrieved variable including the final

classification of plots.

FUN Function used for merging multiple occurrence of species in a single plot.

in_header Logical value indicating whether results of Cocktail classification should be in-

serted to the header of the input vegtable or not. In the second case, a data frame

is provided as output.

Value

A data frame corresponding to the slot header of input object vegtable, including the results of Cocktail classification for the respective plots.

A shaker object.

summary(Wetlands, Wetlands_veg)
```

names

Retrieve names of vegtable and coverconvert objects

Description

Quick access to column names in slot header and names of conversion codes.

These methods provide a quick display of the contents in coverconvert and vegtable objects.

new_relation 23

Usage

```
## S4 method for signature 'vegtable'
names(x)

## S4 method for signature 'vegtable'
dimnames(x)

## S4 method for signature 'coverconvert'
names(x)

## S4 replacement method for signature 'coverconvert'
names(x) <- value</pre>
```

Arguments

x An object of class coverconvert or vegtable.

value A character vector used for replacement methods.

Value

A list containing the names from each slot.

Either a vector or a list (in the case of dimnames()) with the names of variables.

Author(s)

Miguel Alvarez <kamapu78@gmail.com>.

Examples

```
names(Kenya_veg@coverconvert)
names(Kenya_veg)
dimnames(Kenya_veg)
```

new_relation

Insert a new variable as relation in vegtable object

Description

Insert a new variable in slot **header** with a respective table at slot **relations**. The respective variable in header will be set as factor.

Existing categorical variables can also be set as relations. If such variables are factors, its levels can be preserved (missing argument in 'levels') or reset.

24 relation2header

Usage

```
new_relation(object, ...)
## S3 method for class 'vegtable'
new_relation(object, relation, levels, ...)

new_relation(object, levels) <- value

## S4 replacement method for signature 'vegtable, character, character'
new_relation(object, levels) <- value

## S4 replacement method for signature 'vegtable, missing, character'
new_relation(object) <- value</pre>
```

Arguments

object A vegtable object.

... Further arguments passed among methods.

relation, value

A character value indicating the name of the new relation. The parameter 'value'

is used for the replacement method

levels A character vector with the levels for the inserted factor. This may be missing

for variables that already exist in slot header.

Value

A vegtable object with the inserted new relation.

Examples

```
## A brand new variable
new_relation(Kenya_veg, levels = c("forest", "grassland", "cropland")) <- "land_use"
## Set an existing variable as relation
new_relation(Kenya_veg) <- "REMARKS"</pre>
```

relation2header

Insert variables from relations into header

Description

Information associated to categories listed in slot **relations** can be inserted to slot **header** for further statistical comparisons.

shaker-class 25

Usage

```
relation2header(vegtable, ...)
## S3 method for class 'vegtable'
relation2header(vegtable, relation, vars, ...)
```

Arguments

vegtable An vegtable object.

... Further arguments passed among methods

relation A character value indicating the relation to be used for inserting new variables

in slot header.

vars A selection of variables from the relation to be inserted in header. This function

will check the existence of the variables in the respective relation and retrieve an error if none is matching the names. If missing in the arguments, all variables of

the respective relation will be inserted.

Value

A vegtable object.

Author(s)

Miguel Alvarez, kamapu78@gmail.com

Examples

```
## Insert publication year of the source into header
veg <- relation2header(Kenya_veg, "REFERENCE", "YEAR")
## Show the frequency of plots per publication year
summary(as.factor(veg$YEAR))</pre>
```

shaker-class

Class containing Cocktail algorithms.

Description

Objects used for collecting Cocktail definitions.

These objects work as **expert systems** for recognition of defined vegetation units among plots of a **vegtable** object. A shaker object will be always dependent on a **vegtable** object, which is called companion. Since modifications in the companion may affect the functionality of the shaker object, it will be recommended to create the last during a session by a source script instead of recycling them from old R images.

26 subset

Slots

pseudos List containing IDs of taxa that will be merged into pseudo-species.

groups List containing IDs of taxa belonging to the same Cocktail group.

dominants A data frame including lists of species used as dominant species in Cocktail algorithms, as well as operators and cover values used in the formulas.

formulas List with formulas that will be used as definitions for vegetation units.

Author(s)

Miguel Alvarez <kamapu78@gmail.com>

See Also

```
make_cocktail() set_pseudo() set_group() set_formula()
```

Examples

```
showClass("shaker")
```

subset

Subset functions for vegtable objects

Description

Produce subsets of vegtable objects.

Logical operations can be applied either to the plots, or the relations, which are the main slots in that class.

This method can be referred to the slot species the same way as taxlist::subset(), then the rest of the data will include only references to the subset of species list.

```
## S4 method for signature 'vegtable'
subset(
    x,
    subset,
    slot = "header",
    keep_children = FALSE,
    keep_parents = FALSE,
    relation,
    ...
)
```

subset 27

Arguments

A vegtable object for subset. Х subset Logical expression for the subset. slot Character value indicating the slot used as reference for subset. At the moment only the values "taxonNames", "taxonRelations", "taxonTraits", "header", "samples", and "relations" are accepted. The three first values will be applied to the respective slots in the contained taxlist object (slot species). keep_children Argument passed to taxlist::get_children(). keep_parents Argument passed to taxlist::get_parents(). relation Character value indicating the relation (slot relations) to be used as reference for subset. Further arguments passed from or to other methods. . . .

Value

A S4 object of class vegtable.

Author(s)

Miguel Alvarez <kamapu78@gmail.com>

```
## Subset by taxon name
Kenya_sub <- subset(</pre>
  x = Kenya_veg, subset = TaxonName == "Tagetes".
  slot = "taxonNames", keep_children = TRUE, keep_parents = TRUE
)
summary(Kenya_sub)
summary(Kenya_sub@species)
## Subset by taxon relations
Kenya_sub <- subset(</pre>
  x = Kenya_veg, subset = Level == "species",
  slot = "taxonRelations"
)
summary(Kenya_sub)
summary(Kenya_sub@species)
## Subset by taxon traits
Kenya_sub <- subset(</pre>
  x = Kenya_veg, subset = lf_behn_2018 == "obligate_annual",
  slot = "taxonTraits"
summary(Kenya_sub)
summary(Kenya_sub@species)
## Subset by header
Kenya_sub <- subset(x = Kenya_veg, subset = ALTITUDE <= 1000, slot = "header")</pre>
```

28 summary

```
summary(Kenya_sub)

## Subset by samples (after converting coverage)
Kenya_veg <- cover_trans(x = Kenya_veg, to = "cover_percentage", rule = "middle")
Kenya_sub <- subset(x = Kenya_veg, subset = cover_percentage >= 50, slot = "samples")
summary(Kenya_sub)

## Subset by relations
Kenya_sub <- subset(
    x = Kenya_veg, subset = as.integer(YEAR) >= 2000,
    slot = "relations", relation = "REFERENCE"
)
summary(Kenya_sub)
```

summary

Summary method for vegtable objects

Description

Display summaries for vegtable objects.

Those methods are implemented for objects of the classes vegtable, coverconvert and shaker.

The method for class vegtable retrieves the metadata, the size of the object, its validity and additional statistics on the content of input object.

For objects of class shaker, the function summary() will either retrieve general statistics when companion is missing, or a more detailed display when accompained by a taxlist or vegtable object.

```
## S4 method for signature 'vegtable'
summary(object, units = "Kb", ...)

## S4 method for signature 'coverconvert'
summary(object, ...)

## S4 method for signature 'shaker'
summary(object, companion, authority = FALSE, ...)

## S4 method for signature 'vegtable'
show(object)

## S4 method for signature 'vegtable'
print(x, ...)

## S4 method for signature 'coverconvert'
show(object)

## S4 method for signature 'coverconvert'
```

taxa2samples 29

```
print(x, ...)
## S4 method for signature 'shaker'
show(object)
## S4 method for signature 'shaker'
print(x, ...)
```

Arguments

object, x Object to be summarized.

units Units used for object size (passed to format()).

... further arguments to be passed to or from other methods. companion Companion object (either a taxlist or a vegtable object.

authority Logical value indicating whether authors should be displayed or not.

Author(s)

Miguel Alvarez <kamapu78@gmail.com>

Examples

```
## Summary for 'vegtable' objects
summary(Wetlands_veg)
## Summary for 'coverconvert' objects
summary(braun_blanquet)
## Summary for 'shaker' objects (alone and with companion)
summary(Wetlands, Wetlands_veg)
```

taxa2samples

Insert taxon information into samples

Description

For statistical purposes it may be necessary to insert information on recorded taxa into the slot samples, which contain the records of taxa in sampling plots. This can be also done selectively for specific taxonomic ranks and lower ranks can be aggregated to their parental ones.

If column **TaxonConceptID** is already existing in 'objec@samples', this column will get overwritten, retrieving a warning message.

```
taxa2samples(object, ...)
## S3 method for class 'vegtable'
taxa2samples(
  object,
```

30 taxa2samples

```
merge_to,
include_levels,
add_relations = FALSE,
add_traits = FALSE,
...
)
```

Arguments

object A vegtable object.

... Further arguments passed among methods.

merge_to Character value indicating the level (taxonomic rank) to which taxa of lower

rank have to be merged.

include_levels Character vector indicating the levels to be considered in the output object. This

will set the values of TaxonConceptID and any respective values inserted from

slots taxonRelations and taxonTraits as NA.

add_relations A logical value indicating whether the content of slot taxonRelations have to

be inserted in slot samples or not.

add_traits A logical value indicating whether the content of slot **taxonTraits** have to be

inserted in slot samples or not.

Value

An object of class vegtable.

Author(s)

Miguel Alvarez <kamapu78@gmail.com>

```
## Add only variable TaxonConceptID
veg <- taxa2samples(Kenya_veg)
head(veg@samples)

## Add also information from slots taxonRelations and taxonTraits
veg <- taxa2samples(Kenya_veg, add_relations = TRUE, add_traits = TRUE)
head(veg@samples)

## Different ranks recorded at samples
veg <- taxa2samples(Kenya_veg, add_relations = TRUE)
summary(veg@samples$Level)

## Aggregate taxa to family level
veg <- taxa2samples(Kenya_veg, add_relations = TRUE, merge_to = "family")
summary(veg@samples$Level)</pre>
```

trait_stats 31

trait_stats

Statistics and proportion for taxon traits

Description

Calculation of statistics and proportions of taxon traits for plot observations or groups of observations, considering data relationships, taxonomic ranks and the handling of not available values.

In trait_stats() you can use customized functions, which have to be defined as foo(x, w, ...), where 'x' is the (numeric) taxon trait and 'w' is the weight (e.g. the abundance).

With the arguments taxon_levels and merge_to the used taxonomic ranks can be defined, where the first one indicates which ranks have to be considered in the calculations and the second one determine the aggregation of taxa from a lower level to a parental one.

```
trait_stats(trait, object, ...)
## S4 method for signature 'character, vegtable'
trait_stats(
  trait,
  object,
  FUN,
 head_var = "ReleveID",
  taxon_levels,
 merge_to,
 weight,
  suffix = "_stats",
  in_header = TRUE,
  na.rm = TRUE,
)
## S4 method for signature 'formula, vegtable'
trait_stats(trait, object, ...)
trait_proportion(trait, object, ...)
## S4 method for signature 'character, vegtable'
trait_proportion(
  trait,
  object,
 head_var = "ReleveID",
  trait_levels,
  taxon_levels,
 merge_to,
  include_nas = TRUE,
```

32 trait_stats

```
weight,
suffix = "_prop",
in_header = TRUE,
...
)

## S4 method for signature 'formula, vegtable'
trait_proportion(trait, object, ...)
```

Arguments

trait Either a character value indicating the name of trait variable or a formula as 'trait ~ head_var'. Note that you can add multiple variables in the form trait_1 + ... + trait_n ~ head_var. object A vegtable object. Further arguments passed among methods. In the case of the character method, they are passed to 'FUN'. FUN A function usually defined as foo(x, ...) or as foo(x, w, ...) for weighted statistics. head_var Character value, the name of the variable at slot header to be used as aggregation level for the calculation of statistics or proportions. If not provided, the function will use ReleveID by default. taxon_levels Character vector indicating the selected taxonomic ranks to be considered in the output. Character value indicating the taxonomic rank for aggregation of taxa. All ranks merge_to lower than the one indicated here will be assigned to the respective parents at the required taxonomic rank. weight Character value indicating the name of the variable at slot samples used as weight for the proportions. Usually the numeric abundance. suffix A suffix added to the name of the trait variable or to the levels of categorical trait variables. I is meant to avoid homonymous variables within the same object. in_header Logical value indicating whether the output should be inserted in the slot **header** or provided as data frame. In the case that 'head_var' (or the right term in the formula method) is different from **ReleveID**, the statistics and proportions will be inserted in the respective data frame at slot **relations**. A logical value indicating whether NAs should be removed for the calculation na.rm of statistics or not. It is passed to 'FUN' in trait_stats(). trait_levels Character vector indicating a selection of levels from a trait, in the case that some levels should be ignored in the output. Trait levels that are skipped at

output will be still used for the calculation of proportions. This argument gets

include_nas Logical value indicating whether NAs should be considered for the calculation of proportions or not.

only applied for the character method.

tv2vegtable 33

Value

A data frame with the proportions of traits levels or statistics for the trait variable, or an object of class vegtable including those results at the slot header.

Author(s)

Miguel Alvarez <kamapu78@gmail.com>

Examples

```
veg <- cover_trans(Kenya_veg, to = "cover")
veg <- trait_proportion("lf_behn_2018", veg,
    trait_levels = "obligate_annual", weight = "cover", include_nas = FALSE
)
summary(veg$obligate_annual_prop)</pre>
```

tv2vegtable

Import of vegetation data from Turboveg databases

Description

Import function for **Turboveg** databases into an object of class **vegtable**. Most of the contents of **Turboveg** databases are included in DBF files and therefore imported by the function **foreign::read.dbf()**. The automatic setting of database path will be done by the function **vegdata::tv.home()** but it can be customised by the argument **tv_home**.

The species list will be imported by using the function taxlist::tv2taxlist() and therefore formatted as a taxlist object. Similarly, conversion tables will be handled as coverconvert objects.

Empty columns in the header will be deleted in the imported object.

The function tv2coverconvert() reads the content of cover conversion tables stored in **Turboveg** and attempts to reformat them in a more comprehensive structure.

This function is used by tv2vegtable() to import the respective conversion table from **Tur-boveg** databases. Note that conversion tables in **Turboveg** have only stored the middle point for each cover class in a scale, thus it will be recommended to rebuild the coverconvert slot or use braun blanquet.

```
tv2vegtable(
  db,
  tv_home = tv.home(),
  skip_empty_relations = TRUE,
  skip_scale,
  clean = TRUE
)

tv2coverconvert(file, as.is = TRUE)
```

34 tv2vegtable

Arguments

Value

A vegtable object in the case of tv2vegtable(). A coverconvert object in the case of tv2coverconvert().

Author(s)

Miguel Alvarez <kamapu78@gmail.com>

See Also

```
taxlist::tv2taxlist() foreign::read.dbf() vegdata::tv.home()
```

```
## Installed 'Turboveg' version of 'Fujiwara et al. (2014)'
# TV_Home <- file.path(path.package("vegtable"), "tv_data")
# Veg <- tv2vegtable("Fujiwara_2014", TV_Home)
# summary(Veg)
## Installed 'Turboveg' version of "Fujiwara et al. (2014)"
TV_Home <- file.path(path.package("vegtable"), "tv_data", "popup", "Swea")
Table <- tv2coverconvert(file.path(TV_Home, "tvscale.dbf"))

## First scale have to be deleted from conversion table
Table@value <- Table@value[-1]
Table@conversion <- Table@conversion[-1]
summary(Table)

## Compare the 'Turboveg' version with a vegtable version

summary(Table$br_bl)
summary(braun_blanquet$br_bl)</pre>
```

update_det 35

update.	dat
upua te	_uc t

Update by determined specimens

Description

Reference specimens can be integrated in slot **layers** within a **vegtable** object. Updated entries in the specimens can be updated in slot **samples** by using this function. Alternatively expert opinions can be inserted and applied in case of disagreement with the original records.

Usage

```
update_det(x, specimens, ...)
## S4 method for signature 'vegtable,character'
update_det(x, specimens, ...)
```

Arguments

x A vegtable object to be updated.

specimens A character vector indicating the names of tables included in slot layers with

updates to be applied. Note that they will be applied in the same order of the vector in the case of multiple updates.

. Further arguments (not yet in use).

used_synonyms

Retrieve synonyms or taxon concepts used in a data set

Description

Plots records are rather linked to plant names than plant taxon concepts and used_synonyms() lists all synonyms linked to records in a vegtable object, including their respective accepted names.

On the other side, the function used_concepts() produces a subset of the taxonomic list embeded in the slot **species** including only taxonomic concepts linked to records in the slot **samples**.

```
used_synonyms(x, ...)
## S3 method for class 'vegtable'
used_synonyms(x, ...)

used_concepts(x, ...)
## S3 method for class 'vegtable'
used_concepts(x, keep_children = FALSE, keep_parents = FALSE, ...)
```

36 used_synonyms

Arguments

x A vegtable object.

... Further arguments to be passed from or to another methods.

keep_children A logical argument indicating whether children of selected taxa should be in-

cluded in the output or not. This argument passed to get_children().

keep_parents A logical argument indicating whether parents of selected taxa should be in-

cluded in the output or not. This argument passed to get_parents().

Value

The function used_synonyms() returns a data frame including following variables:

SynonymID ID of the taxon usage name applied as synonym.

Synonym The synonym itself.

SynonymAuthor Author of synonym.

TaxonConceptID ID of the respective taxon concept.

AcceptedNameID ID of the taxon usage name set as accepted name of the taxon concept.

AcceptedName The respective accepted name.

AcceptedNameAuthor The author of the accepted name.

The function used_concepts() returns a taxlist object including only taxa occurring in the plot observations of the input vegtable object.

Author(s)

Miguel Alvarez <kamapu78@gmail.com>

See Also

```
accepted_name()
```

```
## Synonyms used in the Kenya_veg
Synonyms <- used_synonyms(Kenya_veg)
head(Synonyms)

## Subset species list to used concepts
species <- used_concepts(Kenya_veg)
Kenya_veg@species
species</pre>
```

vegtable-class 37

vegtable-class

Class vegtable.

Description

Class holding vegetation-plot data sets. Designed to content all information stored in **Turboveg** databases in just one object.

This class was designed to include information of relevés, header data and species in just one object. Objects can be created by calls of the form new("vegtable", ...).

Slots

description A named character vector containing metadata.

samples A data frame with samples list.

header A data frame with plots data.

species Species list as a taxlist object.

layers A list including strata within samples as data frames.

relations A list including popup lists as data frames.

coverconvert A scale conversion object of class coverconvert.

syntax A list including syntaxonomic lists either as data frames or as taxlist objects.

See Also

```
tv2vegtable()
```

Examples

```
showClass("vegtable")
```

vegtable_stat

General statistics from vegtable objects

Description

This function calculates general statistics of local **Turboveg** databases as required by GIVD (Global Index of Vegetation-Plot Databases, https://www.givd.info).

This function is based on a script delivered by GIVD for summarising statistics required in the descriptions of databases (see meta data in the page of the Global Index for Vegetation-Plot Databases).

```
vegtable_stat(vegtable, ...)
## S3 method for class 'vegtable'
vegtable_stat(vegtable, ...)
```

38 veg_aggregate

Arguments

vegtable An object of class vegtable.

... Further arguments passed among methods.

Author(s)

GIVD. Adapted by Miguel Alvarez <kamapu78@gmail.com>

Examples

```
## Statistics for GIVD
vegtable_stat(Kenya_veg)
```

veg_aggregate

Aggregating information into a data frame

Description

Compute summarizing tables from vegtable objects. This function works in a similar way as crosstable().

Usage

```
veg_aggregate(object, data, FUN, ...)
## S4 method for signature 'formula, vegtable, `function`'
veg_aggregate(object, data, FUN, use_nas = TRUE, ...)
```

Arguments

object A formula indicating the variables used for the summary. As in crosstable(), the keywords "TaxonName" and "AcceptedName" can be used to retrieve taxo-

nomic names, where the second will set the accepted name for names considered

as synonyms.

data Either a data frame or an object of class vegtable.

FUN Function used to aggregate values.

... Further arguments passed to the function stats::aggregate().

use_nas Logical value indicating whether NA's should be included in categorical vari-

ables or not.

Value

An object of class data.frame.

veg_diverstiy 39

Author(s)

Miguel Alvarez <kamapu78@gmail.com>

See Also

```
aggregate()
```

Examples

```
## Transform cover to percentage cover
veg <- cover_trans(x = Kenya_veg, to = "cover")

## Frequency of taxa per publication
atab <- veg_aggregate(object = cover ~ AcceptedName + REFERENCE, data = veg, FUN = length)
head(atab)

## Life form proportions per plot
atab <- veg_aggregate(object = cover ~ lf_behn_2018 + ReleveID, data = veg, FUN = sum)
head(atab)</pre>
```

veg_diverstiy

Calculation of statistics at plot level

Description

Calculation of diversity statistics at the plot level allowing for customized functions defined as foo(x, ...), where x is the vector of abundance values.

This function calls taxa2samples() to derive taxa from taxon usage names in slot **samples** and multiple records of species in a single plot will be merged by stats::aggregate.

The functions shannon(), evenness(), and dominance() calculate the diversity index of Shannon, the evenness, and the dominance (1 - evenness), respectively. Dominance is the complementary value to evenness (i.e. 1 - evenness).

The function simpson() calculates the Simpson's index using the alternative for vegetation plot observations.

The function richness() counts the number of taxa per plot and can be used as alternative to vegtable::count_taxa.

```
shannon(x, na.rm = TRUE, ...)
evenness(x, ...)
dominance(x, ...)
```

veg_diverstiy

```
simpson(x, na.rm = TRUE, ...)
richness(x, na.rm = TRUE, ...)

veg_diversity(object, ...)

## S3 method for class 'vegtable'
veg_diversity(
  object,
  weight,
  FUN = shannon,
  aggr_fun = mean,
  arg_fun = list(),
  var_name,
  in_header = TRUE,
  ...
)
```

Arguments

X	A numeric vector containing the abundance of single species.
na.rm	A logical value indicating whether NA values should be removed from the abundance vector or not.
	Further arguments passed among methods. In 'evenness()' and 'dominance()' these arguments are passed to 'shannon()'. In 'veg_diversity()', these arguments are passed to aggregate() (actually to 'FUN').
object	A vegtable object.
weight	A character value indicating the name of the column at slot samples which will be used as species abundance.
FUN	A function used to calculate the diversity index.
aggr_fun	A function used to aggregate abundance values for multiple records of a taxon in a plot observation. Average value is used by default.
arg_fun	A named list with parameters and arguments passed to taxa2samples(), which will retrieve the respective taxon concept for each taxon usage name and can be used to merge taxa at a determined taxonomic rank, for instance to merge all sub-specific taxa into their respective species (i.e. 'merge_to = "species"').
var_name	A character value used as name for the calculated index. If missing, the name of the function will be used.
in_header	A logical value indicating whether the results should be included as variables in the slot header of the input object. If 'in_header = TRUE', you may assign the result of the function to the input object.

Value

Functions shannon(), evenness(), dominance(), simpson(), and richness() return a numeric value (the calculated index).

veg_relation 41

Funtion veg_diversity() produce either a data frame with calculated values per plot observation (option 'in_header = FALSE') or a vegtable object with the calculated values inserted in the slot **header** (option 'in_header = TRUE').

Examples

```
## Compare Evenness with Shannon index
Kenya_veg <- cover_trans(x = Kenya_veg, to = "cover")
Kenya_veg <- veg_diversity(object = Kenya_veg, weight = "cover")
Kenya_veg <- veg_diversity(object = Kenya_veg, weight = "cover", FUN = evenness)
with(Kenya_veg@header, plot(shannon, evenness))</pre>
```

veg_relation

Retrieve or replace relations in vegtable objects

Description

Tables providing information about levels of categorical variables in the header are called popups in **Turboveg** databases but relations in vegtable objects. Such variables will be converted into factors in the slot header according to the levels and their sorting in the respective relation.

Usage

```
veg_relation(vegtable, relation, ...)
## S4 method for signature 'vegtable, character'
veg_relation(vegtable, relation, match_header = FALSE, ...)
veg_relation(vegtable) <- value
## S4 replacement method for signature 'vegtable,data.frame'
veg_relation(vegtable) <- value</pre>
```

Arguments

vegtable An object of class vegtable.

relation A character value indicating the relation table to be retrieved or replaced.

... Further arguments to be passed among methods.

Match_header A logical vector, whether only levels occurring in slot header should be considered or all.

value A data frame containing the new veg_relation.

Value

This function retrieves and object of class data. frame. In the replacement method, an object of class vegtable, including value in the slot relations.

42 Wetlands-data

write_juice 43

write_juice

Exporting tables for Juice

Description

This function produce txt files as inport formats for **Juice** (https://www.sci.muni.cz/botany/juice/).

This function produces two output files to be imported into a **Juice** file: A vegetation table produced by crosstable() and a header table. Both tables share the file name plus a suffix (table for the vegetation table and header for the header).

For the import in **Juice**, you go to the menu File -> Import -> Table -> from Spreadsheet File (e.g. EXCEL Table) and then follow the wizard. Do not forget to select the proper settings in the wizard: 1) 'Character delimiting columns: Comma' (for default argument values). 2) 'Use the second column as layer information: Unchecked'. 3) 'Cover values: Percentage Values'.

To further import the header table you need to go to the menu File -> Import -> Header Data -> From Comma Delimited In the header (see **Value**), the first column (Table number) corresponds to the plot number assigned by **Juice** at import, while the column (Releve number) is the number originally assigned to the plot (e.g. **Turboveg** ID).

Usage

```
write_juice(data, file, formula, ...)

## S4 method for signature 'vegtable, character, formula'
write_juice(
  data,
  file,
  formula,
  FUN,
  db_name = "Plot Observations",
  header,
  coords,
  sep = ",",
  ...
)

read_juice(file, encoding = "LATIN-1", sep = ";", na = "", ...)
```

Arguments

```
An object of class vegtable.

file Character value indicating the name of output files (without file extension).

formula A formula passed to crosstable().

Further arguments. While write_juice() passes them to the function crosstable(), read_juice() passes those arguments to readLines().
```

44 write_juice

FUN Funtion passed to crosstable().

db_name Name for data set displayed in inport wizard.

header Variables of header to be exported.

coords Names of coordinate variables in header of data.

sep Separator used to split rows into columns.

encoding Argument passed to readLines.

na Character used as not available values.

Value

For read_juice(), a list with two elements: A data frame of species by plot (cross_table), and a data frame with header data (header).

Author(s)

Miguel Alvarez <kamapu78@gmail.com>

```
## Subset and transform cover values to percentage
vegetation <- Kenya_veg[1:20, ]
vegetation <- cover_trans(x = vegetation, to = "cover_percent", rule = "middle")

## Write in tempdir
write_juice(data = vegetation, file = file.path(tempdir(), "SWEA"),
    formula = cover_percent ~ ReleveID + AcceptedName, FUN = mean,
    header = c("ReleveID", "COMM_TYPE"))

## Installed 'Juice' version of 'Wetlands_veg'
Veg <- file.path(path.package("vegtable"), "juice", "Wetlands_juice.txt")
Veg <- read_juice(Veg)

summary(Veg)</pre>
```
